Cash Flow Reporting (RLE Accounting) Thomas A. Lee, 2014-02-05 This collection explores Kuhn's 1970 perception of a scientific revolution in the form of a cyclical sequence of anomaly recognition; insecurity, alternative ideas, schools of thought and dominating practices. Cash flow reporting has become a dominant accounting practice which emerged from a developmental process of Kuhnian form. The text is constructed around the various stages identified by Kuhn and selected readings are categorised accordingly.

Standby Power Management Architecture for Deep-submicron Systems Michael Alan Sheets, 2006 In deep-submicron processes a significant portion of the power budget is lost in standby power due to increasing leakage effects. For systems that have long idle times punctuated by bursts of activity, such as PDAs, cell-phones, and wireless sensor networks nodes, this standby power consumption reduces the effectiveness of duty-cycling. This work surveys a number of subthreshold leakage reduction techniques and identifies supply rail gating MTCMOS as the most promising. MTCMOS is a dynamic technique that has two distinct modes: an active processing mode and a lower power sleep mode. The smallest area implementations of MTCMOS have the side-effect of losing the state of the system when in sleep mode. This complicates the resumption of the active mode, because traditional designs are intolerant to the loss of state. This work presents a general framework to reduce the state maintenance requirements during sleep mode without losing information required to resume the active mode. The framework is applied to finite state machines and microprocessors, since these are commonly used in system design. Partitioning the system into subsystems with individually controlled supply rails termed power domains allows fine-grain control of the power mode for portions of the chip. Each power domain must be dynamically put in the appropriate power mode to ensure correct system operation while minimizing power consumption. This control logic collectively forms the core of a power manager. Most power manager implementation approaches are largely ad-hoc and custom designed for each application. This work presents a structured methodology and architecture for the implementation and control of power domains to form a power managed system. Approaches to the partitioning and implementation of individual power domains are explored. The functional requirements for the power manager

Adaptive Processing of Sequences and Data Structures C. Lee Giles, 1998-03-25 Tenascin, a recently characterized extracellular matrix (ECM) protein which is expressed during embryonic and fetal development, wound healing and various benign and malignant tumors (but highly restricted in normal adult tissues) is believed to affect a number of cellular functions such as cellular growth, differentiation, adhesion and motility. It has been extensively studied in recent years to elucidate cellular phenomena that are associated with development, tissue regeneration and neoplastic growth and behavior. It may be a potential target in the treatment of cancers and other disorders. This book focuses mainly on tissue expression and the poorly known biological role of this ECM protein.

Neural Networks and Analog Computation Hava T. Siegelmann, 2012-12-06 The theoretical foundations of Neural Networks and Analog Computation conceptualize neural networks as a particular type of computer consisting of multiple assemblies of basic processors interconnected in an intricate structure. Examining these networks under various resource constraints reveals a continuum of computational devices, several of which coincide with well-known classical models. On a mathematical level, the treatment of neural computations enriches the theory of computation but also explicated the computational complexity associated with biological networks, adaptive engineering tools, and related models from the fields of control theory and nonlinear dynamics. The material in this book will be of interest to researchers in a variety of engineering and applied sciences disciplines. In addition, the work may provide the base of a graduate-level seminar in neural networks for computer science students.

Strength or Accuracy: Credit Assignment in Learning Classifier Systems Tim Kovacs, 2012-12-06 Classifier systems are an intriguing approach to a broad range of machine learning problems, based on automated generation and evaluation of condition/action rules. In reinforcement learning tasks they simultaneously address the two major problems of learning a policy and generalising over it (and related objects, such as value functions). Despite over 20 years of research, however, classifier systems have met with mixed success, for reasons which were often unclear. Finally, in 1995 Stewart Wilson claimed a long-awaited breakthrough with his XCS system, which differs from earlier classifier systems in a number of respects, the most significant of which is the way in which it calculates the value of rules for use by the rule generation system. Specifically, XCS (like most classifiersystems) employs a genetic algorithm for rule generation, and the way in which it calculates rule fitness differs from earlier systems. Wilson described XCS as an accuracy-based classifiersystem and earlier systems as strength-based. The two differ in that in strength-based systems the fitness of a rule is proportional to the return (reward/payoff) it receives, whereas in XCS it is a function of the accuracy with which return is predicted. The difference is thus one of credit assignment, that is, of how a rule's contribution to the system's performance is estimated. XCS is a Q learning system; in fact, it is a proper generalisation of tabular Q-learning, in which rules aggregate states and actions. In XCS, as in other Q-learners, Q-values are used to weight action selection.

New Trends in Computer Graphics Nadia Magnenat-Thalmann, Daniel Thalmann, 2012-12-06 New Trends in Computer Graphics contains a selection of research papers submitted to Computer Graphics International '88 (CGI '88). CGI '88 is the Official Annual Conference of the Computer Graphics Society. Since 1982, this conference has been held in Tokyo. This year, it is taking place in Geneva, Switzerland. In 1989, it will be held in Leeds, U. K. , in 1990 in Singapore, in 1991 in U. S. A. and in 1992 in Montreal, Canada. Over 100 papers were submitted to CGI '88 and 61 papers were selected by the International Program Committee. Papers have been grouped into 6 chapters. The first chapter is dedicated to Computer Animation because it deals with all topics presented in the other chapters.

Several animation systems are described as well as specific subjects like 3D character animation, quaternions and splines. The second chapter is dedicated to papers on Image Synthesis, all particular new shading models and new algorithms for ray tracing are presented. Chapter 3 presents several algorithms for geometric modeling and new techniques for the creation and manipulation of curves, surfaces and solids and their applications to CAD. In Chapter 4, an important topic is presented: the specification of graphics systems and images using languages and user-interfaces. The last two chapters are devoted to applications in sciences, medicine, engineering, art and business.

Soft Computing in Engineering Design and Manufacturing Pravir K. Chawdhry,Rajkumar Roy,Raj K. Pant,2012-12-06
Soft Computing has emerged as an important approach towards achieving intelligent computational paradigms where key elements are learning from experience in the presence of uncertainties, fuzzy belief functions, and evolution of the computing strategies of the learning agent itself. Fuzzy, neural and evolutionary computing are the three major themes of soft computing. The book presents original research papers dealing with the theory of soft computing and its applications in engineering design and manufacturing. The methodologies have been applied to a large variety of real life problems. Application of soft computing has provided the opportunity to integrate human like 'vagueness' and real life 'uncertainty' to an otherwise 'hard' computer programme. Now, a computer programme can learn, adapt, and evolve using soft computing. The book identifies the strengths and limitations of soft computing techniques, particularly with reference to their engineering applications. The applications range from design optimisation to scheduling and image analysis. Goal optimisation with incomplete information and under uncertainty is the key to solving real-life problems in design and manufacturing. Soft computing techniques presented in this book address these issues. Computational complexity and efficient implementation of these techniques are also major concerns for realising useful industrial applications of soft computing. The different parts in the book also address these issues. The book contains 9 parts, 8 of which are based on papers from the '2nd On-line World Conference on Soft Computing in Engineering Design and Manufacture (WSC2),.

Static Timing Analysis for Nanometer Designs J. Bhasker,Rakesh Chadha,2009-04-03
Timing, timing, timing! That is the main concern of a digital designer charged with designing a semiconductor chip. What is it, how is it described, and how does one verify it? The design team of a large digital design may spend months architecting and iterating the design to achieve the required timing target. Besides functional verification, the timing closure is the major milestone which dictates when a chip can be released to the semiconductor foundry for fabrication. This book addresses the timing verification using static timing analysis for nanometer designs. The book has originated from many years of our working in the area of timing verification for complex nanometer designs. We have come across many design engineers trying to learn the background and various aspects of static timing analysis. Unfortunately, there is no book currently available that can be used by a working engineer to get acquainted with the details of static timing analysis. The chip designers lack a central reference for information on timing, that covers the basics to the advanced timing verification procedures and techniques.
