Observation of CP Violation in $B^\pm \rightarrow DK^\pm$ Decays Paolo Gandini, 2013-09-05 CP violation is a well-established phenomenon in particle physics, but until 2001 it was only observed in kaons. In the last decade, several matter-antimatter asymmetries have been observed in neutral B mesons in line with the expectations of the Standard Model of the weak interaction. Direct CP violation is also expected in the decay rates of charged B+ mesons versus that of B- mesons, though the greatest effects are present in a decay that occurs just twice in 10 million decays. Such rarity requires huge samples to study and this is exactly what the LHC, and its dedicated B-physics experiment LHCb provide. This thesis presents an analysis of the first two years of LHCb data. The author describes the first observation of the rare decay, $B^- \rightarrow DK^-$, $D \rightarrow \pi^- K^+$ and the first observation of direct CP violation in this B decay. The work constitutes essential information on the experiment's measurement of a fundamental parameter of the theory and stands as a benchmark against which subsequent analyses of this type will be compared.

Search for the Decay $K_L \rightarrow \pi^0 \nu \bar{\nu}$ at the J-PARC KOTO Experiment Kota Nakagiri, 2020-08-20 This book reports on a new result from the $KL \rightarrow \pi^0 \nu \nu$ search at the J-PARC KOTO experiment, which sets an upper limit of 3×10^{-9} for the branching fraction of the decay at the 90% confidence level, improving the previous best limit by an order of magnitude. To explain the matter-antimatter asymmetry in the universe, still unknown new physics beyond the standard model (SM) that breaks CP symmetry is necessary. The rare decay of a long-lived neutral K meson, $KL \rightarrow \pi^0 \nu \nu$, is a CP-violating decay. It is an excellent probe to search for new physics because new physics can contribute to the decay and change its branching fraction, while the SM is as small as 3×10^{-11} . However, it is extremely difficult to search for because all of the decay products are neutral and two neutrinos are undetectable. The $KL \rightarrow \pi^0 \nu \nu$ signal is identified by measuring two photons from a π^0 with a calorimeter and confirming the absence of any other detectable particles with hermetic veto counters. The book contributes to the analysis of neutron-induced backgrounds which were the dominant background sources in the search. For the background caused by two consecutive hadronic showers in the calorimeter due to a neutron, the author evaluated the background yield using a data-driven approach. For another background caused by an η meson production— η decays two photons—by a neutron that hits a veto counter near the calorimeter, the author developed an original analysis technique to reduce it. The book also contributes to the analysis of the normalization modes ($KL \rightarrow 3\pi^0$, $KL \rightarrow 2\pi^0$, $KL \rightarrow 2\gamma$) to measure KL yield, the estimation of the signal acceptance based on a simulation, and the evaluation of the trigger efficiency. As a result, significant improvements in the measurement were achieved, and this is an important step in the continuing higher sensitivity search, which can reach new physics with the energy scales up to O(100-1000 TeV).

Search for Flavor-Changing Neutral Current Top Quark Decays $t \rightarrow Hq$, with $H \rightarrow b\bar{b}$, in pp Collisions at $\sqrt{s} = 8$ TeV with the ATLAS Detector Shota Tsiskaridze, 2017-08-02 This PhD thesis focuses on the search for flavor-changing neutral currents in the decay of a top quark to an up-type quark ($q = u, c$) and the Standard Model Higgs boson, where the Higgs boson decays to $b\bar{b}$. Further, the thesis presents the combination of this search for top quark pair events with other ATLAS searches – in the course of which the most restrictive bounds to date on tqH interactions were obtained. Following on from the discovery of the Higgs boson, it is particularly important to measure the Yukawa couplings of the Standard Model fermions; these parameters may provide crucial insights to help solve the flavor puzzle and may help reveal the presence of new physics before it is directly observed in experiments.

Searching for New Physics in $b \rightarrow sl+l^-$ Transitions at the LHCb Experiment Luca Pescatore, 2017-10-04 This thesis presents two analyses of semileptonic $b \rightarrow sl+l^-$ decays using Flavour Changing Neutral Currents (FCNCs) to test for the presence of new physics and lepton flavour universality, and the equality of couplings for different leptons, which on the basis of experimental evidence is assumed to hold in the Standard Model, free from uncertainties as a result of knowledge of the hadronic matrix elements. It also includes the angular analysis of $\Lambda_b \rightarrow \Lambda \mu \mu$ decay and the R_{K^*} measurement, both of which are first measurements, not yet performed by any other experiment.

Search for the Pentaquark Θ^+ via the $\pi^- p \rightarrow K^- X$ Reaction at J-PARC Manabu Moritsu, 2016-02-17 This theses reports on an experimental search for an exotic hadron, $\Theta^+(1540)$ pentaquark, which is a genuine exotic hadron with a five-quark system of $uudds\bar{b}$. The results of this book support that the existence of Θ^+ was strongly constrained. The Θ^+ pentaquark was searched for via the $\pi^- p \rightarrow K^- X$ reaction using a beam momentum of 2.01 GeV/c at the J-PARC hadron experimental facility, taking advantage of high-statistics and high-resolution compared with previous experiments, some of which claimed the evidence of Θ^+ . In order to realize a good missing-mass resolution of 2 MeV, the beam spectrometer and superconducting kaon spectrometer were constructed. No clear peak was observed in the missing mass spectrum of the $\pi^- p \rightarrow K^- X$ reaction, and the upper limit of the production cross section was found to be less than 0.28 $\mu\text{b/sr}$ at the 90% confidence level in a mass region of 1500–1560 MeV/c². This upper limit is an order of magnitude smaller than that of the previous KEK experiment. Compared with a theoretical calculation using the effective Lagrangian approach, the decay width of Θ^+ was evaluated. The upper limits on the decay width were estimated to be 0.36 and 1.9 MeV for the Θ^+ spin-parity of $1/2^+$ and $1/2^-$, respectively. These are quite small for a width of ordinary hadron resonances, and the existence of Θ^+ was strongly constrained and is doubtful.

Search for $t\bar{t}H$ Production in the $H \rightarrow b\bar{b}$ Decay Channel Marcel Rieger, 2021-02-25 In 1964, a mechanism explaining the origin of particle masses was proposed by Robert Brout, François Englert, and Peter W. Higgs. 48 years later, in 2012, the so-called Higgs boson was discovered in proton-proton collisions recorded by experiments at the LHC. Since then, its ability to interact with quarks remained experimentally unconfirmed. This book presents a search for Higgs bosons produced in association with top quarks $t\bar{t}H$ in data recorded with the CMS detector in 2016. It focuses on Higgs boson decays into bottom quarks $H \rightarrow b\bar{b}$ and top quark pair decays involving at least one lepton. In this analysis, a multiclass classification approach using deep learning techniques was applied for the first time. In light of the dominant background contribution from $t\bar{t}$ production, the developed method proved to achieve superior sensitivity with respect to existing techniques. In combination with searches in different decay channels, the presented work contributed to the first observations of $t\bar{t}H$ production and $H \rightarrow b\bar{b}$ decays.

Search for the Standard Model Higgs Boson in the $H \rightarrow ZZ \rightarrow l + l - qq$ Decay Channel at CMS Francesco Pandolfi, 2013-08-15 The theoretical foundations of the Standard Model of elementary particles relies on the existence of the Higgs boson, a particle which has been revealed for the first time by the experiments run at the Large Hadron Collider (LHC) in 2012. As the Higgs boson is an unstable particle, its search strategies were based on its decay products. In this thesis, Francesco Pandolfi conducted a search for the Higgs boson in the $H \rightarrow ZZ \rightarrow l + l - qq$ Decay Channel with 4.6 fb⁻¹ of 7 TeV proton-proton collision data collected by the Compact Muon Solenoid (CMS) experiment. The presence of jets in the final state poses a series of challenges to the experimenter: both from a technical point of view, as jets are complex objects and necessitate of ad-hoc reconstruction techniques, and from an analytical one, as backgrounds with jets are copious at hadron colliders, therefore analyses must obtain high degrees of background rejection in order to achieve competitive sensitivity. This is accomplished by following two directives: the use of an angular likelihood discriminant, capable of discriminating events likely to originate from the decay of a scalar boson from non-resonant backgrounds, and by using jet parton flavor tagging, selecting jets compatible with quark hadronization and discarding jets more likely to be initiated by gluons. The events passing the selection requirements in 4.6 fb⁻¹ of data collected by the CMS detector are examined, in the search of a possible signal compatible with the decay of a heavy Higgs boson. The thesis describes the statistical tools and the results of this analysis. This work is a paradigm for studies of the Higgs boson with final states with jets. The non-expert physicists will enjoy a complete and eminently readable description of a proton-proton collider analysis. At the same time, the expert reader will learn the details of the searches done with jets at CMS.

Observation of $\nu_\mu \rightarrow \nu_e$ Oscillation in the T2K Experiment Kei Ieki, 2015-12-24 In this thesis the author contributes to the analysis of neutrino beam data collected between 2010 and 2013 to identify $\nu_\mu \rightarrow \nu_e$ events at the Super-Kamiokande detector. In particular, the author improves the pion-nucleus interaction uncertainty, which is one of the dominant systematic error sources in T2K neutrino oscillation measurement. In

the thesis, the measurement of $\nu\mu\rightarrow\nu e$ oscillation in the T2K (Tokai to Kamioka) experiment is presented and a new constraint on δCP is obtained. This measurement and the analysis establish, at greater than 5 σ significance, the observation of $\nu\mu\rightarrow\nu e$ oscillation for the first time in the world. Combining the T2K $\nu\mu\rightarrow\nu e$ oscillation measurement with the latest findings on oscillation parameters including the world average value of θ_{13} from reactor experiments, the constraint on the value of δCP at the 90% confidence level is obtained. This constraint on δCP is an important step towards the discovery of CP violation in the lepton sector.

Brahman→E = MC2 (Science and the Mystical Secrets of the Universe) James Wallace,2022-07-22 Our century, the 20th, will complete the two thousandth year after Christ’s appearance. Many students of mysticism and the occult believe that the last years of this century will complete another world cycle in the development of man. Nostradamus was one among many, who prophesied a global catastrophe in the year 1999. Certainly, the growth in scientific knowledge over the last 100 years and the ever increasing pace at which new discoveries are being made, gives one the impression that mankind is trying to catch up on lost time. Physics in particular has undergone some revolutionary changes. Newtonian concepts and ideas though still valid in general terms have been superimposed by what is today popularly known as the New Physics. We are now literally looking into the heart of matter, which despite its solidity is nevertheless recognised as energy that has developed substance on the ‘wings of speed’. In fact, so closely are velocity and mass interlinked that in many experiments it is impossible to distinguish one from the other. Faced with this dilemma even our scientists have begun to philosophize. New theories and concepts that appear bizarre when first encountered by the non-scientist are constantly being brandished in scientific circles, every one of them being supported by algebraic equations. Machines which are four miles long have been constructed to study the behaviours of these tiny subatomic pellets of energy. And it has been found that they are the product of a mysterious void, appearing from and disappearing into nowhere. Further, all subatomic particles appear to be born with a death wish. No sooner are they created, they disintegrate into other more stable particles, as if they were born with the desire to sacrifice themselves for the continued propagation of our material reality.
