Report of the Progressive Management Pathway for Improving Aquaculture Biosecurity (PMP/AB): First Technical Working Group Meeting Food and Agriculture Organization of the United Nations , 2020-08-01 This report presents the results of a Technical Working Group (TWG) meeting, where experts from competent authorities, intergovernmental organizations, the aquaculture industry, academe, and research institutions examined the two previous consultations on the Progressive Management Pathway for Improving Aquaculture Biosecurity (PMP/AB) and clarified issues and concerns raised during these two consultations. A consensus was reached on the definition of the PMP/AB as a pathway that builds on existing frameworks, supported by appropriate tools (via the “PMP/AB toolkit”). The PMP/AB focuses on aquaculture biosecurity, which includes health management and reduction of antimicrobial resistance (AMR). The PMP/AB will not directly focus on food safety; however, it will promote sustainable aquaculture production with good husbandry practices, environmental practices, and prudent treatment or antimicrobial use.

**Seneca the Elder and His Rediscovered ›Historiae ab initio bellorum civilium‹** Maria Chiara Scappaticcio,2020-06-08 The refreshed insights into early-imperial Roman historiography this book offers are linked to a recent discovery. In the spring of 2014, the binders of the archive of Robert Marichal were dusted off by the ERC funded project PLATINUM (ERC-StG 2014 n°636983) in response to Tiziano Dorandi's recollections of a series of unpublished notes on Latin texts on papyrus. Among these was an in-progress edition of the Latin rolls from Herculaneum, together with Marichal's intuition that one of them had to be ascribed to a certain 'Annaeus Seneca'. PLATINUM followed the unpublished intuition by Robert Marichal as one path of investigation in its own research and work. Working on the Latin P.Herc. 1067 led to confirm Marichal's intuitions and to go beyond it: P.Herc. 1067 is the only extant direct witness to Seneca the Elder's Historiae. Bringing a new and important chapter of Latin literature arise out of a charred papyrus is significant. The present volume is made up of two complementary sections, each of which contains seven contributions. They are in close dialogue with each other, as looking at the same literary matter from several points of view yields undeniable advantages and represents an innovative and fruitful step in Latin literary criticism. These two sections express the two different but interlinked axes along which the contributions were developed. On one side, the focus is on the starting point of the debate, namely the discovery of the papyrus roll transmitting the Historiae of Seneca the Elder and how such a discovery can be integrated with prior knowledge about this historiographical work. On the other side, there is a broader view on early-imperial Roman historiography, to which the new perspectives opened by the rediscovery of Seneca the Elder's Historiae greatly contribute.

*Ab Initio Calculations of Conformational Effects on <sup>13</sup>C NMR Spectra of Amorphous Polymers* R. Born, H.W. Spiess, 2012-12-06 In NMR, it is well-known that the chemical shift conveys structural information, e. g. a carbonyl carbon will have a resonance frequency appreciably different from a methyl carbon, etc. The relation between structure and chemical shift is mostly established by empirical rules on the basis of prior experience. It is only quite recently that the advent of both comparatively cheap computing power and novel quantum chemistry approaches have provided feasible routes to calculate the chemical shift at the ab initio level for molecules of reasonable size. This raises the question whether application of these novel theoretical concepts offers a means of obtaining new structural information for the complex chain molecules one deals with in polymer science. Solid state <sup>13</sup>C-NMR spectra of glassy amorphous polymers display broad, partially structured resonance regions that reflect the underlying disorder of the polymer chains. The chemical shift responds to the variation of the geometry of the chain, and the broad resonance regions can be explained by an inhomogeneous superposition of various chain geometries (and thus chemical shifts). In this review, we present a novel approach to combine polymer chain statistical models, quantum chemistry and solid state NMR to provide quantitative information about the local chain geometry in amorphous polymers. The statistical model yields the relative occurrence of the various geometries, and quantum chemistry (together with a force field geometry optimization) establishes the link between geometry and chemical shift.
