Frac Without a K John W. Ely, 2022-04-07 The book titled FRAC without a K is actually the third edition of the initial book written in 1985. I got the inspiration for the initial book, titled Stimulation Treatment handbook, from working with a young Engineer who was in distress because of cheating on frac treatments. The original book was designed to instruct personnel on how to oversee fracs-basically understand what was going on and what to expect from the service company. There was, sadly, felonious activity going on in the oilfield and I took it upon myself to do what I could to stop this behavior. The activity was pretty well eliminated when the very large lawsuit occurred between Parker and Parsley and BJ Services occurred in the late 80's. Without going into details the lawsuit was settled for 270 million dollars which was a huge sum in the late 80's. I have included the 1994 edition 2 to show the improvements and advances that have occurred in our industry in 27 years. I include the second edition to show where my mind might have changed but also to allow a younger generation to see where we came from. I placed a lot of emphasis on historical changes as well as discussing at length the waterfrac revolution. My very subjective comments on waterfracs, small sand and actual design of slick water treatments is indeed controversial but not to me. I can state there is nothing equivalent to this book in our industry. You can find books with massive amount of equations or sales pitch phenomena but nothing anywhere as readable as FRAC without a K. I have included hopefully for your enjoyment, war stories and pictures and descriptions of directional kill blowouts I have attended worldwide.

**When the Hills Are Gone** Thomas W. Pearson, 2017-10-31 Fracking is one of the most controversial methods of fossil fuel extraction in the United States, but a great deal about it remains out of the public eye. In Wisconsin it has ignited an unprecedented explosion in the state's sand mining operations, an essential ingredient in hydraulic fracturing that has shaken local communities to the core. In *When the Hills Are Gone*, Thomas W. Pearson reveals the jolting impact of sand mining on Wisconsin's environment and politics. A source of extraordinary wealth for a lucky few, and the cause of despoiled land for many others, sand mining has raised alarm over air quality, water purity, noise, blasting, depressed tourism, and damage to the local way of life. It has also spurred a backlash in a grassroots effort that has grown into a mature political movement battling a powerful mining industry. *When the Hills Are Gone* tells the story of Wisconsin's sand mining wars. Providing on-the-ground accounts from both the mining industry and the concerned citizens who fought back, Pearson blends social theory, ethnography, stirring journalism, and his own passionate point of view to offer an essential chapter of Wisconsin's history and an important episode in the national environmental movement. Digging deep into the struggles over place, community, and local democracy that are occurring across the United States, *When the Hills Are Gone* gives vital insight into America's environmental battles along the unexpected frontlines of energy development.

A Data Analytics Framework for Analyzing the Effect of Frac Hits on Parent Well Production Yifei Guo, 2021 Well interference, which is commonly referred to as frac hits, has become a significant factor affecting production in fractured horizontal shale wells with the increase in infill drilling in recent years. Today, there is still no clear understanding on how frac hits affect production. This work aims to develop a process to automatically identify the different types of frac hits and to determine the effects of stage-to-well distance and frac hit intensity on long-term parent well production. First, child well completions data and parent well pressure data are processed by a frac hit detection algorithm to automatically identify different frac hit intensities and duration within each stage. This algorithm classifies frac hits based on the magnitude of the differential pressure spikes. The frac stage to parent well distance is also calculated. Then, we compare the daily production trend before and after the frac hits to determine the severity of its influence on production. Finally, any evident correlations between the stage-to-well distance, frac hit intensity and production change are identified and investigated. In addition, this work also introduces a novel pressure integration approach to better understand the prolonged production effects of sustained frac hits. The methodology was to first characterize every induced pressure change in a parent well (i.e. to determine frac-hit intensity), and subsequently to estimate the average daily production change after each frac hit. This was accomplished by utilizing a frac hit auto-detection algorithm and a log-log analysis of daily production. To add the effect of interference time (i.e. the time of the pressure change caused by the frac hit), a PCI metric was calculated for each parent well. Finally, the effects of frac-hit intensity and interference time on parent well production were quantified through correlation analysis. This work utilizes 3 datasets covering 13 horizontal wells in the Bakken formation and 37 horizontal wells in the Eagle Ford Shale formation. These datasets included well trajectories, child well completions data, parent well pressure data and parent well production data. The data analysis results include factors influencing frac hit intensity and production responses to different types of frac hits. Also, the result shows that both frac hit intensity and interference time impacts parent well production. This work not only adds new understandings to frac hit study, but also challenges some of the previous work

*LaTeX in 24 Hours* Dilip Datta, 2017-06-27 This book presents direct and concise explanations and examples to many LaTeX syntax and structures, allowing students and researchers to quickly understand the basics that are required for writing and preparing book manuscripts, journal articles, reports, presentation slides and academic theses and dissertations for publication. Unlike much of the literature currently available on LaTeX, which takes a more technical stance, focusing on the details of the software itself, this book presents a user-focused guide that is concerned with its application to everyday tasks and scenarios. It is packed with exercises and looks at topics like formatting text, drawing and inserting tables and figures, bibliographies and indexes, equations, slides, and provides valuable explanations to error and warning messages so you can get work done with the least time and effort needed. This means LaTeX in 24 Hours can be used by students and researchers with little or no previous experience with LaTeX to gain quick and noticeable results, as well as being used as a quick reference guide for those more experienced who want to refresh their knowledge on the subject.

Establishing Well Operability Limits for Frac Pack Sandface Well Completions Using a Screen Erosion Model and Well Completion Score Card Rickey Lynn Hendrix, 2013 Completion quality has a direct impact upon the maximum production rate at which a frac pack well should be operated. Best practices for frac pack well completions ensure the highest possible quality for the well completion. A novel frac pack well completion score card was developed based on best practices for frac pack well completions identified through consultation with industry experts. The score card systematically combines and assesses completions data readily available standard completion reports. The outcome of the score card process is a numerical completion quality rating, which combines all well design and frac pack operations information. The completion quality rating is integrated with a proprietary screen erosion tool that determines fluid velocity exiting the perforations at the inside of the surface of the casing ( $V_c$ ), and calculates an associated fluid velocity at the sand screen ( $V_s$ ) based on results of a computational fluid dynamics model. A C-factor based on fluid velocity at the casing perforations is used to determine the safe drawdown operating limit for the frac pack well. The frac pack completion score card provides a substantial improvement to previous methods of determining frac pack well operational limits, by combining all known factors contributing to well completion quality and identifying how those factors ultimately affect the well's maximum allowable drawdown. The frac pack score card also raises awareness of the best practices identified in the research and therefore promotes the use of those best practices during frac pack installation. The score card and associated screen erosion model have been tested and verified by industry, and have been accepted for industry use--Abstract, leaf iii.

Principal factors that gave a boost to hydraulic fracturing in the U.S. included dwindling sources of conventional oil and gas, discovery of unconventional sources of shale oil and gas and improvements in hydraulic fracturing technology. Hydraulic fracturing which involves extraction of oil and gas from shale formations uses sand, water and chemicals. Under high pressure the rocks are fractured and are held open by sand particles to allow for free flow of oil and gas. Sand used in this process is called frac sand. It is exceptionally hard, pure quartz, with uniform size and of high quality. Currently hydraulic fracturing accounts for about 50% of oil produced in the U.S., decreasing reliance on imported crude oil from 60% to 39%, and U.S. interest in oil-rich countries. The frac sand mining (FSM) industry has grown exponentially and so have FSM facilities especially in Wisconsin where about 40% of frac sand is produced. This has raised controversies in FSM communities and resulted in inter/intra-community conflicts and tensions over social, environmental, economic and moral issues. This exploratory research was to investigate the underlying factors for support/opposition in Blair and Whitehall, both cities in Trempealeau County. The aim was to determine how perceptions have shaped public acceptance of FSM development. Using mail surveys and interviews with stakeholders of the industry, it was observed that overall, there was general opposition in both cities. Three main categories of perceptions were identified - those who oppose (17%), the undecided (45%) and supporters (38%). Differences in 62% of responses across the categories were statistically significant. Principal reasons for support included job creation, economic benefits and contributions from mines. Reasons cited for opposition included perceived environmental and health risks and destruction of the landscape. In a logistic regression, factors which predicted support were institutional (preferred level of regulation), site-specific (perceived costs, perceived benefits and perceived risks) and socio-demographic (gender and city of residence). At the city level, there was less opposition in Blair than in Whitehall. Financial benefits from FSM companies, the concept of place attachment and the extent to which resident's everyday lives are interfered with due to locations of FSM facilities, were proffered as underlying reasons for differential opposition.
