On Full Duplex Wireless Networks Mhd Omar Alkadri,2017 Finally, we present a cross-layer aided routing protocol, termed as X-FDR, for multi-hop FD wireless networks. X-FDR exploits a Physical (PHY) layer model capturing imperfection of SI cancellation. At the medium access control (MAC) layer, X-FDR adopts an optimized MAC protocol which implements a power control mechanism without creating the hidden terminal problem. X-FDR exploits the unique characteristics of FD technology at the network layer to construct energy-efficient and low latency routes in the network.

Mobility Management in Wireless IP Networks Mathalenta Jane Rosa Ngwane,2013 Mobility management plays a significant role in the current and the future Internet in delivering effective services to the mobile users on the move. This research proposes a mobility management architectural framework that will incorporate wireless mobility architecture and call admission control. To achieve this we carried out three tasks, (i) the architectural basis for the mobility management strategy for real-time data communication was established. (ii) a suitable call admission criteria and a corresponding call admission control algorithm for the strategy was defined. (iii) a simulated performance evaluation of the strategy was developed. The results obtained are as follows: (i) this study resulted in a strategy that prioritizes calls of the guaranteed services class over calls of other classes, (ii) the higher priority of handoff calls over new calls has been achieved; and (iii) the proposed Call Admission Control(CAG) algorithm shows to have an acceptable performance with an average acceptance rate of calls of up to 83%. In conclusion this study resulted in a CAC algorithm that prioritizes real-time traffic over non real-time traffic as well as handoff calls over new calls.

Applications of Polynomial Systems David A. Cox,2020-03-02 Systems of polynomial equations can be used to model an astonishing variety of phenomena. This book explores the geometry and algebra of such systems and includes numerous applications. The book begins with elimination theory from Newton to the twenty-first century and then discusses the interaction between algebraic geometry and numerical computations, a subject now called numerical algebraic geometry. The final three chapters discuss applications to geometric modeling, rigidity theory, and chemical reaction networks in detail. Each chapter ends with a section written by a leading expert. Examples in the book include oil wells, HIV infection, phylogenetic models, four-bar mechanisms, border rank, font design, Stewart-Gough platforms, rigidity of edge graphs, Gaussian graphical models, geometric constraint systems, and enzymatic cascades. The reader will encounter geometric objects such as Bézier patches, Cayley-Menger varieties, and toric varieties; and algebraic objects such as resultants, Rees algebras, approximation complexes, matroids, and toric ideals. Two important subthemes that appear in multiple chapters are toric varieties and algebraic statistics. The book also discusses the history of elimination theory, including its near elimination in the middle of the twentieth century. The main goal is to inspire the reader to learn about the topics covered in the book. With this in mind, the book has an extensive bibliography containing over 350 books and papers.
