Mass Murder, Police Mayhem Dean Beeby,2023-08-29 A layperson's guide to the report that explains how the senseless tragedy in Portapique happened, and how we can prevent such violence in the future. In this book Dean Beeby distills the extensive research of the Mass Casualty Commission into a readable account of exactly what happened during 13 chaotic hours when 22 Nova Scotians were murdered in April 2020. The commission tracked the perpetrator's movements and pieced together the actions of all involved RCMP members. The Mounties' fatal errors – failing to believe citizens reporting that the murderer was driving a replica RCMP car and failing to recognize his back road escape route among many others – are documented in the report and set out in this book. Dean Beeby describes the background to these events, including the numerous times the killer was involved with police and their repeated failures to deal with the danger he represented to his community and the public. The Commission made 130 recommendations for action, two-thirds of them dealing with the RCMP. Dean Beeby offers a plain language description of each of these recommendations, enabling readers to keep track of how the RCMP and other agencies respond to the commission's demands for major reforms. The Mass Casualty Commission's exhaustive investigation cost almost \$50 million, and yielded a massive final report. The report was published in seven volumes of 3,000 pages in total. This book is intended to give readers access to the key content of this important public record.

Geo-information Mathias Lemmens,2011-08-03 Geomatics, the handling and processing of information and data about the Earth, is one geoscience discipline that has seen major changes in the last decade, as mapping and observation systems become ever more sensitive and sophisticated. This book is a unique and in-depth survey of the field, which has a central role to play in tackling a host of environmental issues faced by society. Covering all three strands of geomatics - applications, information technology and surveying - the chapters cover the history and background of the subject, the technology employed both to collect and disseminate data, and the varied applications to which geomatics can be put, including urban planning, assessment of biodiversity, disaster management and land administration. Relevant professionals, as well as students in a variety of disciplines such as geography and surveying, will find this book required reading. This rapidly developing field uses increasingly complex and accurate systems. Today, technology enables us to capture geo-data in full 3D as well as to disseminate it via the Web at the speed of light. We are able to continuously image the world from space at resolutions of up to 50 cm. Airborne LiDAR (laser surveying) sensors can be combined with digital camera technology to produce geometrically correct images of the Earth's surface, while integrating these with large-scale topographic maps and terrestrial as well as aerial images to produce 3D cityscapes that computer users can explore from their desktops.

Surveying for Engineers John Uren,Bill Price,2018-03-13 The fifth edition of this classic textbook sets out the essential techniques needed for a solid grounding in the surveying. The popular and trusted textbook covers the traditional topics such as levelling, measurement of angles, measuring distances, and how to carry out

traversing and compute coordinates, as well as the latest technological advances. It is packed with clear illustrations, exercises and worked examples, making it both a comprehensive study aid for students and a reliable reference tool for practitioners. This text is aimed at students studying surveying as either part of a civil engineering, building or construction course or as a separate discipline. It is also useful for students who undertake surveying as an elective subject and is a useful resource for practising surveyors. New to this Edition: - The latest developments in Global Navigation Satellite Systems (GNSS) particularly the introduction of network RTK and OS Net and their applications - Recent developments in survey instruments, methods and digital technologies including image processing with total stations and laser planners, developments in data processing and integration and updates on Ordnance Survey mapping products

The Use of Oblique and Vertical Images in 3D Urban Modelling Ahmed Hamruni,2019-02-21 Investigating the geometric potential for using Pictometry oblique and vertical imagery to provide 3D city modelling and texturing is of crucial importance. Most people view the world from the ground, so the revolutionary Pictometry oblique imagery can be used for texture mapping large models quickly and can enable photorealism. Terrestrial imagery might be combined with oblique imagery in certain areas to give better quality models, particularly when 'ground level' viewing of the models is required. It is necessary to create and analyse different photogrammetric blocks of images that used the relatively new imaging system, Pictometry, which combines five cameras in one cluster producing vertical images as well as oblique images from the 4 compass directions. The images are provided with information so that potentially, efficient photogrammetric processing can take place. The quality of the direct measurement of the position and orientation of the images will have a direct influence on the quality of the 'mapping'; 3D ground point coordination.
