FIZ Chemie, Berlin

Dictionary of Common Names / Trivialnamen-Handbuch FIZ Chemie, Berlin, 1993-08-12 This remarkable reference work is a thoroughly revised and extensively expanded new edition of the widely acclaimed 'Trivialnamenkartei'. Easy to use and up-to-date, this three-volume set covers some 28 000 trivial names of 22 000 substances - almost twice as many as the German-language first edition. This handbook is the key to a wealth of useful information on 22 000 organic compounds. They include: * non-systematic names of simple organic compounds * names of natural products with known constitutions * common acronyms of important compounds * selected trade names of dyes, drugs and other industrial chemical products Each entry gives the trivial name of the compound, in English and German, the structural formula with full stereochemistry, the molecular formula, the CAS Registry Number, and a citation selected for maximum information on synthesis, structure and activity. Volume Three contains two comprehensive indexes which guarantee users the quickest way from common name to structure.

Asean John Fry, 2011-04 Describes trends in regional integration, export competitiveness, and inbound investment for six industries within the ASEAN: computer components, cotton woven apparel, hardwood plywood and flooring, healthcare services, motor vehicle parts, and palm oil. The ASEAN members created a regional 'Roadmap for Integration' (Roadmap) for each priority sector, and while these Roadmaps have promoted tariff reductions and streamlined certain administrative procedures, their success in promoting regional integration has been mixed. In general, economic factors and national government policies have had more influence than the Roadmaps over regional industrial structures. Charts and tables. Band Structure Engineering in Semiconductor Microstructures R.A. Abram, M.

Jaros, 2012-12-06 This volume contains the proceedings of the NATO Advanced Research Workshop on Band Structure Engineering in Semiconductor Microstructures held at Il Ciocco, Castelvechio Pascali in Tuscany between 10th and 15th April 1988. Research on semiconductor microstructures has expanded rapidly in recent years as a result of developments in the semiconductor growth and device fabrication technologies. The emergence of new semiconductor structures has facilitated a number of approaches to producing systems with certain features in their electronic structure which can lead to useful or interesting properties. The interest in band structure engineering has stimd ated

a variety of physical investigations and novel device concepts and the field now exhibits a fascinating interplay between pure physics and device technology. Devices based on microstructures are useful vehicles for fundamental studies but also new device ideas require a thorough understanding of the basic physics. Around forty researchers gathered at I1 Ciocco in the Spring of 1988 to discuss band structure engineering in semiconductor microstructures.

Lower-Dimensional Systems and Molecular Electronics Robert M. Metzger, Peter R. Day, George C. Papavassiliou, 2013-11-11 This volume represents the written account of the NATO Advanced Study Institute Lower-Dimensional Systems and Molecular Electronics held at Hotel Spetses, Spetses Island, Greece from 12 June to 23 June 1989. The goal of the Institute was to demonstrate the breadth of chemical and physical knowledge that has been acquired in the last 20 years in inorganic and organic crystals, polymers, and thin films, which exhibit phenomena of reduced dimensionality. The interest in these systems started in the late 1960's with lower-dimensional inorganic conductors, in the early 1970's with quasi-one-dimensional crystalline organic conductors, which by 1979 led to the first organic superconductors, and, in 1977, to the first conducting polymers. The study of monolayer films (Langmuir-Blodgett films) had progressed since the 1930's, but reached a great upsurge in the early 1980's. The pursuit of non-linear optical phenomena became increasingly popular in the early 1980's, as the attention turned from inorganic crystals to organic films and polymers. And in the last few years the term 'molecular electronics' has gained ever-increasing acceptance, although it is used in several contexts. We now have organic superconductors with critical temperatures in excess of 10 K, conducting polymers that are soluble and processable, and used commercially; we have films of a few monolayers that have high in-plane electrical conductivity, and polymers that show great promise in photonics; we even have a few devices that function almost at the molecular level.
