PC Safety 101 Michael Jason,2021 As a successful entrepreneur you need to communicate all day, every day, with your customers, suppliers, partners, employees, and others. You need to keep records. You need to have reliable access to email and the internet. Nasty little software programs are out there which will slow, snarl or even stop your computer and your Internet connection. Some of them will track your activity, and some will even mine your personal or business information. This malicious software – or “malware” for short – is an every day problem that can, if left unchecked, render your computer worthless, harm your business, and potentially even harm your life. Have you noticed mysterious slowdowns in your computer’s performance, even when you only have one or two programs (apparently) running? Have you noticed a lag in your web surfing, even though you have a very fast broadband connection? Almost certainly if you have, it’s because spyware or adware is taxing your system, slowing things down for you while sending information you may not want sent, to places you almost certainly don’t want it sent to. The bad news is that this stuff is everywhere now, including coming from sites of reputable companies that you have chosen to do business with. There are probably dozens, maybe even hundreds, of pieces of bad tracking software and viruses lurking on your computer right now. The better news is that as in real life medicine, an ounce of prevention beats a pound of cure... And the best news is that you can malware-proof your computer for very little money and without any special computer knowledge! This report is all about understanding malware, its forms, purposes, and effects; and even more importantly the various ways you can employ to stop it, find it, and destroy it. The answer to minimizing the presence of and eliminating damage from malware is a combination of settings, software, and surfing choices. While we do suggest you have a firewall, a firewall is really designed to stop other kinds of problems, like malicious remote access issues (people “breaking into” your system) and like wireless security is really a different category from malware. In this report we’re going to focus on malware specifically. First let’s take a quick look at the three major categories of malware. In the biggest categorical sense, viruses and spyware represent very different basic issues.

Protect Your PC: Prevent Viruses, Malware, and Spyware from Ruining Your Computer Afi-Odelia Scruggs, 2012-02-29 ABOUT THE BOOK Three of saddest words in English are “If I'd only...” As in, “If I'd only invested in blue-chip stocks,” or “If I'd only saved some money...” But those words become more tragic when applied to your PC. “If I'd only backed up my PC, I wouldn't have lost all my files,” or, “if I'd only updated my anti-virus software, I wouldn't have to buy a new computer” are thoughts that must confronted all too often. Just thinking about those disasters can make one cry. Having a damaged PC is a tragedy, because many problems are preventable. You just need the right strategies and tools. Arming your PC doesn't require lots of money or time. Just follow these basic steps MEET THE AUTHOR Afi is a content creator who has more than 20 years experience as a journalist and author. Her work has appeared in Essence magazine, The Washington Post Outlook section and on www.bet.com. She is a former columnist for the Plain Dealer in Cleveland and has worked at newspapers in Mississippi, Ohio and greater Washington D.C. Afi has written three books: a picture book for children, a memoir, and a collection of essays on knitting. Presently, she is producing audio stories and blogging on journalism, writing and content creation at www.aoscruggs.com EXCERPT FROM THE BOOK When you get the flu, viruses use your body to reproduce and spread. A computer virus uses your PC in a similar way. The virus embeds itself in a legitimate program, but it can't execute or open by itself. Opening the infected program executes the virus, and trouble starts. The effect can more devastating if the malware is a worm. A worm is a type of virus that spreads throughout networks. It's more dangerous because it can replicate itself. In 2000, the “I Love You” worm infected more than 50 million computers. Its victims included the British Parliament, the CIA, and the Pentagon. Anti-virus software can keep viral programs from turning your PC into an incubator. If the software detects a virus, it can remove or quarantine it. However, viruses are created constantly, so anti-viral software requires regular updates to be effective. You can configure the program to update automatically and you can also schedule regular scans of your entire system. You don't have to spend a lot of money to get decent software. Here are the top 3 free antivirus programs, courtesy of PC World magazine: Buy a copy to keep reading!
