The Personal Computer Book Peter McWilliams,1983

Fumbling the Future Douglas K. Smith,Robert C. Alexander,1999 Ask consumers and users what names they associate with the multibillion dollar personal computer market, and they will answer IBM, Apple, Tandy, or Lotus. The more knowledgable of them will add the likes of Microsoft, Ashton-Tate, Compaq, and Borland. But no one will say Xerox. Fifteen years after it invented personal computing, Xerox still means copy. Fumbling the Future tells how one of America's leading corporations invented the technology for one of the fastest-growing products of recent times, then miscalculated and mishandled the opportunity to fully exploit it. It is a classic story of how innovation can fare within large corporate structures, the real-life odyssey of what can happen to an idea as it travels from inspiration to implementation. More than anything, Fumbling the Future is a tale of human beings whose talents, hopes, fears, habits, and prejudices determine the fate of our largest organizations and of our best ideas. In an era in which technological creativity and economic change are so critical to the competitiveness of the American economy, Fumbling the Future is a parable for our times.

Algorithmically Specialized Parallel Computers Lawrence Snyder,Leah H. Jamieson,Dennis B. Gannon,2014-05-10 Algorithmically Specialized Parallel

Computers focuses on the concept and characteristics of an algorithmically specialized computer. This book discusses the algorithmically specialized computers, algorithmic specialization using VLSI, and innovative architectures. The architectures and algorithms for digital signal, speech, and image processing and specialized architectures for numerical computations are also elaborated. Other topics include the model for analyzing generalized inter-processor, pipelined architecture for search tree maintenance, and specialized computer organization for raster graphics display. The data base applications of the FETCH-AND-ADD instruction, distributed parallel architecture for speech understanding, and two parallel formulations of particle-in-cell models are likewise covered in this text. This publication is suitable for students, researchers and professionals concerned with algorithmically specialized computers.

Computers for Librarians Stuart J. Ferguson,Rodney Hebels,2003-08-01 Computers for Librarians is aimed primarily at students of library and information management and at those library and information service professionals who feel the need for a book that will give them a broad overview of the emerging electronic library. It takes a top-down approach, starting with applications such as the Internet, information sources and services, provision of access to information resources and library management systems, before looking at data management, computer systems and technology, data communications and networking, and library systems development. It also provides an interesting set of case studies, which help to put theoretical and technical issues into context. Computers for Librarians can be read as a survey of where we are in terms of the electronic library, but it is also intended as an educational resource, and includes self-learning aids such as learning objectives, keywords and review questions for each chapter.

40th Anniversary Volume: Advancing into the 21st Century ,2000-05-23 Humans are often distinguished from other animals by their ability, even need, to see patterns in everyday life. As we enter a new millennium, all aspects of society seem to want to take stock of what has happened in the past and what is likely to happen in the future. The computer industry is no different from others. Advances in Computers has been published continuously since 1960 and this year's volume is the fiftieth technical volume in the series (two index volumes were published as volumes 50 and 51). Since it is the fortieth year of publication, we decided to look back on the changes that have occurred since Volume 1 of Advances in computers appeared in 1960. We looked at the six chapters of that initial volume and decided that an appropriate anniversary volume for this series would be a collection of papers on the same topics that appeared in 1960. What has happened to those technologies? Are we making the progress we thought we would or are events moving more slowly? Business computing Numerical weather prediction Spoken language Language understanding Microprocessor design Computer games

Using Computers in History Myrddin John Lewis,Roger Lloyd-Jones,1996 History and Computingintroduces its readers to the history and practice of historical computing. While functioning as a practical introduction to the field, this book is designed also to raise awareness of the use of computers as an important tool for the historian, discussing such topics as the pattern of 19th century emigration from the UK; the performance of the American and German economies in the 1930s; and the Lancashire cotton industry, all of which demonstrate possibilities which computers offer to the historian. Through practical workshop exercises, History and Computingprovides a skills-enabling introduction to basic computer terminology. Examining the use of spreadsheets and how historians design and work with them, the book includes spreadsheet exercises based around a range of historical data sets. In addition, the authors explore the use of databases and demonstrate how to construct them. Merging historical exploration and practical instruction, History and Computingencourages further study and prompts its readers to apply the skills they have learnt to a number of examples.

Keeping the U.S. Computer Industry Competitive National Research Council,Computer Science and Telecommunications Board,1990-02-01 This book warns that retaining U.S. preeminence in computing at the beginning of the next century will require long-term planning, leadership, and collective will that cannot be attained with a business-as-usual approach by industry or government. This consensus emerged from a colloquium of top executives from the U.S. computer sector, university and industry researchers, and government policymakers. Among the major issues discussed are long-term, or strategic, commitment on the part of large firms in the United States; cooperation within and among firms and between industry, universities, and government; weaknesses in manufacturing and in the integration of research, development, and manufacturing; technical standards for both hardware and software manufacture and operation; and education and infrastructure (in particular, computer networks).
