*Corotating Interaction Regions* A. Balogh,J.T. Gosling,J.R. Jokipii,R. Kallenbach,H. Kunow,2013-06-29 A Corotating Interaction Region (CIR) is the result of the interaction of fast solar wind with slower solar wind ahead. CIRs have a very large three-dimensional extent and are the dominant large-scale structure in the heliosphere on the declining and minimum phase of the solar activity cycle. Until recently, however, CIRs could only be observed close to the ecliptic plane, and their three-dimensional structure was therefore not obvious to observers and theoreticians alike. Ulysses was the first spacecraft allowing direct exploration of the third dimension of the heliosphere. Since 1992, when it has entered a polar orbit that takes it 0 up to 80 latitude, the spacecraft's performance has been flawless and the mission has provided excellent data from a superbly matched set of instruments. Perhaps the most exciting observation during Ulysses' first passage towards the south pole of the Sun was a strong and long lasting CIR whose energetic particle effects were observed up to unexpectedly high latitudes. These observations, documented in a number of publications, stimulated considerable new theoretical work.

**Transport Across the Boundaries of the Magnetosphere** Bengt Hultqvist,Marit Øieroset,2012-12-06 The present volume is the second one in the Space Sciences Series of ISSI (International Space Science Institute) and the October 1997 issue of Space Science Reviews. It contains the proceedings of the first workshop in the ISSI study project on Source and Loss Processes of Magnetospheric Plasma, which was held at ISSI in Bern on October 1-5, 1996. The participants in the project, the project team, numbered at that time 51, of whom 45 participated in the workshop. The main tasks of the first workshop were to provide a basis for the further work by means of presentation and discussion of those 16 review papers which are published in this volume and to prepare plans for the work of six working groups in the year up to the second workshop in October 1997. The ISSI study project on Source and Loss Processes of Magnetospheric Plasma was selected by ISSI in December 1995 as

the first in the solar-terrestrial physics field after consulting a number of groups of senior scientists representing the international space physics community at large. The undersigned, Bengt Hultqvist, is the project leader. A Core Group, consisting of two co-chairs for each of six working groups and four ex-officio members from the Space Science Committee of ISSI (H. Balsiger, A. Galeev, G. Haerendel, and D. Southwood), convened at ISSI in March 1996.

**Lonely Wrong** Ulas ISSI, 1992-09-01 NATURE OF LOVE A passion for love for the people to live? A passion that has been tried to be discovered for a lifetime. Perhaps even after death. A search. The main motive of life. Yes, a passion for search! The quest is and therefore passion is death, life, nature, freedom, knowledge, pleasures, suffering, sexuality and deity! From the beginning of the universe, love has been tried to be defined by lots of philosophers, lots of scientists and also by many crazy people! ..... SNOWDROP Beauty and evil, time itself; relative like it is; temporary as it is. ....

Solar Variability and Climate E. Friis-Christensen, 2000-12-31 Proceedings of an ISSI Workshop, 28 June - 2 July 1999, Bern, Switzerland

From Dust to Terrestrial Planets Willy Benz, R. Kallenbach, Günter Lugmair, 2012-12-06 The workshop From Dust to Terrestrial Planets was initiated by a working group of planetary scientists invited to ISSI by Johannes Geiss in November 1997. The group split to focus on three topics, one of which was the history of the early solar system, including the formation of the terrestrial planets in the inner solar system. Willy Benz, Gunter Lugmair, and Frank Podosek were invited to convene planetary scientists, astrophysicists, and cosmochemists to synthesize the current knowledge on the origin and evolution of our inner planetary system. The convenors raised the interest of scientists from all over the world in the detailed assessment of the available astronomical, chronological, geochemical and dynamical constraints of the first period of inner solar system evolution. In particular, this included appraisal of the newest results from astronomical observations by the Hubble Space Telescope, the Infrared Space Observatory, and other space and ground-based facilities of solar-like systems and nebular disks, possibly representing early stages of the solar accretion disk and planet formation. At the same time, the current models of the origin, evolution, transport, and accretion processes of circumstellar disks were presented. This included the new insights provided by the recent discovery of extrasolar giant planets, which were considered insofar as they are relevant to the overall dynamics of the inner part of the solar system.

**Cosmic Rays in the Heliosphere** L.A. Fisk, J.R. Jokipii, G.M. Simnett, Rudolf von Steiger, K.-P. Wenzel, 2013-04-17 In every scientific discipline there are milestones - periods of significant accomplishment when it is appropriate to pause and summarize the state of the field. Such is the case for the study of the behavior of cosmic rays in the heliosphere. We are just passing through solar minimum conditions, when the heliosphere has a well-ordered and relatively simple configuration. We have been fortunate to have an array of spacecraft - unprecedented in the history of space exploration and unlikely to be repeated for generations - to provide comprehensive measurements of

cosmic rays throughout the heliosphere. Ulysses has completed its historic first exploration of the heliosphere at high heliographic latitudes. Pioneer and Voyager have been exploring the outer heliosphere. The durable IMP-8 and now the WIND spacecraft have provided detailed baseline measurements at Earth. Concurrently, there has been a steady improvement in theoretical understanding of cosmic ray behavior through the use of ever more sophisticated numerical models. This milestone in cosmic ray studies was celebrated with a Workshop on Cosmic Rays in the Heliosphere which was convened by L. A. Fisk, J. R. Jokipii.

*The Heliosphere in the Local Interstellar Medium* Rudolf von Steiger, R. Lallement, M. A. Lee, 2012-12-06 In summary, we can conclude that the contributions of the different ionization processes to the total ionization rate for the most abundant interstellar species are basically known. The ionization of the noble gases He and Ne is almost completely dominated by photoionization, whereas for H charge-exchange with the solar wind is most important. For other species, such as O and Ar, both processes contribute significantly. Electron impact ionization can typically contribute by ~10% to the total rate in the inner Solar System. Because direct measurements of the solar EUV flux are not yet continuously available, the variation of the ionization rate over the solar cycle still contains a relatively large uncertainty. The recent measurements of pickup ion distributions and of the neutral helium gas provide an independent tool to determine the total ionization rate that can be used to cross calibrate with the results obtained for the individual ionization processes. Acknowledgements The authors are grateful to M. Allen for supplying us with new data on photoionization cross-sections compiled by him. We thank also M. Gruntman for drawing our attention to and support in collecting the most recent data on charge-exchange cross-sections. D. R. was supported by grant No. 2 P03C. 004. 09 from the Committee for Scientific Research (Poland). This work was also supported in part through NASA contract NAS7-918, NSF Grant INT-911637, NASA Grant NAGW- 2579.

**DIFFERENT IS NORMAL** Issi Johanson, 2017-02-19 Falling in love can be hard, but it is even harder when you know you are with the right person. Kim never dreamed that she would be in a relationship like this, but she's determined to make it work.

**Primordial Nuclei and Their Galactic Evolution** Nikos Prantzos, Monica Tosi, Rudolf von Steiger, 2012-12-06 The present volume, the fourth one in the Space Sciences Series of ISSI (International Space Science Institute), contains the proceedings of a workshop on Primordial Nuclei and Their Galactic Evolution, which was held at ISSI in Bern on 6-10 May 1997. This topic was chosen following some general enquiries with the scientific community concerning its desirability and timeliness. Five convenors, D. Duncan, C. Hogan, J. Linsky, N. Prantzos, and H. Reeves (chair) subsequently set up the workshop, nominated a list of invitees, structured the workshop into a series of introductory talks and into six topical working groups (early Universe extragalactic objects - low-Z stars - galactic disk and galactic evolution - solar nebula - local interstellar medium), and described the tasks of the working groups in a list of keywords. It is the main task of ISSI to bring together space scientists, ground-based observers, and theorists from different fields and to give them the opportunity to discuss

and compare their results, thus contributing to the achievement of a deeper understanding, adding value to those results through multi-disciplinary research in an atmosphere of international co-operation. In that spirit the convenors selected participants working in fields ranging from Big Bang theory to observers of today's Solar System, thus spanning the widest possible range both in time and space.

Physics of Collisionless Shocks André Balogh, Rudolf A. Treumann, 2013-01-04 The present book provides a contemporary systematic treatment of shock waves in high-temperature collisionless plasmas as are encountered in near Earth space and in Astrophysics. It consists of two parts. Part I develops the complete theory of shocks in dilute hot plasmas under the assumption of absence of collisions among the charged particles when the interaction is mediated solely by the self-consistent electromagnetic fields. Such shocks are naturally magnetised implying that the magnetic field plays an important role in their evolution and dynamics. This part treats subcritical shocks which dissipate flow energy by generating anomalous resistance or viscosity. The main emphasis is, however, on super-critical shocks where the anomalous dissipation is insufficient to retard the upstream flow. These shocks, depending on the direction of the upstream magnetic field, are distinguished as quasi-perpendicular and quasi-parallel shocks which exhibit different behaviours, reflecting particles back upstream and generating high electromagnetic wave intensities. Particle acceleration and turbulence at such shocks become possible and important. Part II treats planetary bow shocks and the famous Heliospheric Termination shock as examples of two applications of the theory developed in part I.
