Minimal Rationality Christopher Cherniak, 1990-03-14 In Minimal Rationality, Christopher Cherniak boldly challenges the myth of Man the the Rational Animal and the central role that the perfectly rational agent has had in philosophy, psychology, and other cognitive sciences, as well as in economics. His book presents a more realistic theory based on the limits to rationality which can play a similar generative role in the human sciences, and it seeks to determine the minimal rationality an actual agent must possess.

Minimal Submanifolds and Related Topics Y. L. Xin, 2003 The Bernstein problem and the Plateau problem are central topics in the theory of minimal submanifolds. This important book presents the Douglas-Obata solution to the Plateau problem, but the main emphasis is on the Bernstein problem and its new developments in various directions: the value distribution of the Gauss image of a minimal surface in Euclidean 3-space, Simons' work for minimal graph hypersurfaces, and author's own contributions to Bernstein type theorems for higher codimension.

The Global Theory of Minimal Surfaces in Flat Spaces William Meeks, A. Ros, H. Rosenberg, 2002-03-25 In the second half of the twentieth century the global theory of minimal surface in flat space had an unexpected and rapid blossoming. Some of the classical problems were solved and new classes of minimal

surfaces found. Minimal surfaces are now studied from several different viewpoints using methods and techniques from analysis (real and complex), topology and geometry. In this lecture course, Meeks, Ros and Rosenberg, three of the main architects of the modern edifice, present some of the more recent methods and developments of the theory. The topics include moduli, asymptotic geometry and surfaces of constant mean curvature in the hyperbolic space.

The Minimal Cell Pier Luigi Luisi, Pasquale Stano, 2010-11-01

In the last ten years there has been a considerable increase of interest on the notion of the minimal cell. With this term we usually mean a cell-like structure containing the minimal and sufficient number of components to be defined as alive, or at least capable of displaying some of the fundamental functions of a living cell. In fact, when we look at extant living cells we realize that thousands of molecules are organized spatially and functionally in order to realize what we call cellular life. This fact elicits the question whether such huge complexity is a necessary condition for life, or a simpler molecular system can also be defined as alive. Obviously, the concept of minimal cell encompasses entire families of cells, from totally synthetic cells, to semi-synthetic ones, to primitive cell models, to simple biomimetic cellular systems. Typically, in the experimental approach to the construction of minimal the main ingredient is the compartment. Lipid vesicles (liposomes) are used to host simple and complex molecular transformations, from single or multiple enzymic reactions, to polymerase chain reactions, to gene expression. Today this research is seen as part of the broader scenario of synthetic biology but it is rooted in origins of life studies, because the construction of a minimal cell might provide biophysical insights into the origins of primitive cells, and the emergence of life on earth. The volume provides an overview of physical, biochemical and functional studies on minimal cells, with emphasis to experimental approaches. 15 International experts report on their

innovative contributions to the construction of minimal cells.

Minimal Ideas Werner Abraham, 1996-01-01 The articles in this volume are inspired by the Minimalist Program first outlined in Chomsky's MIT Fall term class lectures of 1991 and in his seminal paper A Minimalist Program for Linguistic Theory. The articles seek to develop further some key idea in the Minimalist Program, sometimes in ways deviating from the course taken by Chomsky. The articles are preceded by a 40 page introduction into the minimalist framework. The introduction pays special attention to the question how the minimalist framework developed out of the Principles and Parameters (Government and Binding) framework. The introduction serves as a guide through the entire volume, presenting the issues to be discussed in the articles in detail, and offering a thematic overview over the volume as a whole. Most of the articles in this volume are concerned with issues raised in Chomsky's first two minimalist papers, namely A Minimalist Program for Linguistic Theory (1993, first distributed in 1992) and Bare Phrase Structure (1995a, first distributed 1994). In acknowledgment of this, each article starts out with a quote from Chomsky (1993, 1995a). This quote also serves to highlight the particular grammatical or theoretical issue that is primarily discussed in the relevant article. Several articles relate issues raised in Chomsky's first two minimalist papers to the basic ideas in Kayne's book, The Antisymmetry of Syntax (1994, distributed in part in manuscript form in 1993). In many respects, therefore, these articles develop alternatives to ideas proposed in chapter 4, Categories and Transformations, of Chomsky's most recent book, The Minimalist Program (1995b). Some of the articles contain references to chapter 4, and some comments on similarities and differences between ideas developed in these papers and in chapter 4 of Chomsky 1995b can also be found in the Introduction to this volume.

Minimal Surfaces, Stratified Multivarifolds, and the Plateau Problem A. T. Fomenko, 1991-02-21 Plateau's problem is

a scientific trend in modern mathematics that unites several different problems connected with the study of minimal surfaces. In its simplest version, Plateau's problem is concerned with finding a surface of least area that spans a given fixed one-dimensional contour in three-dimensional space--perhaps the best-known example of such surfaces is provided by soap films. From the mathematical point of view, such films are described as solutions of a second-order partial differential equation, so their behavior is quite complicated and has still not been thoroughly studied. Soap films, or, more generally, interfaces between physical media in equilibrium, arise in many applied problems in chemistry, physics, and also in nature. In applications, one finds not only two-dimensional but also multidimensional minimal surfaces that span fixed closed ``contours" in some multidimensional Riemannian space. An exact mathematical statement of the problem of finding a surface of least area or volume requires the formulation of definitions of such fundamental concepts as a surface, its boundary, minimality of a surface, and so on. It turns out that there are several natural definitions of these concepts, which permit the study of minimal surfaces by different, and complementary, methods. In the framework of this comparatively small book it would be almost impossible to cover all aspects of the modern problem of Plateau, to which a vast literature has been devoted. However, this book makes a unique contribution to this literature, for the authors' guiding principle was to present the material with a maximum of clarity and a minimum of formalization. Chapter 1 contains historical background on Plateau's problem, referring to the period preceding the 1930s, and a description of its connections with the natural sciences. This part is intended for a very wide circle of readers and is accessible, for example, to first-year graduate students. The next part of the book, comprising Chapters 2-5, gives a fairly complete survey of various modern trends in Plateau's problem. This section is accessible to second- and third-year students specializing in

physics and mathematics. The remaining chapters present a detailed exposition of one of these trends (the homotopic version of Plateau's problem in terms of stratified multivarifolds) and the Plateau problem in homogeneous symplectic spaces. This last part is intended for specialists interested in the modern theory of minimal surfaces and can be used for special courses; a command of the concepts of functional analysis is assumed.

Minimal NetworksThe Steiner Problem and Its

Generalizations Alexander O. Ivanov,Alexei A.

Tuzhilin,1994-03-16 This book focuses on the classic Steiner Problem and illustrates how results of the problem's development have generated the Theory of Minimal Networks, that is systems of rubber branching threads of minimal length. This theory demonstrates a brilliant interconnection among differential and computational geometry, topology, variational calculus, and graph theory. All necessary preliminary information is included, and the book's simplified format and nearly 150 illustrations and tables will help readers develop a concrete understanding of the material. All nontrivial statements are proved, and plenty of exercises are included.

Minimal Surfaces II Ulrich Dierkes,Stefan

Hildebrandt,Albrecht Küster,Ortwin Wohlrab,2013-03-14 Minimal Surfaces I is an introduction to the field of minimal surfaces and a presentation of the classical theory as well as of parts of the modern development centered around boundary value problems. Part II deals with the boundary behaviour of minimal surfaces. Part I is particularly apt for students who want to enter this interesting area of analysis and differential geometry which during the last 25 years of mathematical research has been very active and productive. Surveys of various subareas will lead the student to the current frontiers of knowledge and can also be useful to the researcher. The lecturer can easily base courses of one or two semesters on differential geometry on Vol. 1, as many topics are worked out in great detail. Numerous computer-generated

illustrations of old and new minimal surfaces are included to support intuition and imagination. Part 2 leads the reader up to the regularity theory for nonlinear elliptic boundary value problems illustrated by a particular and fascinating topic. There is no comparably comprehensive treatment of the problem of boundary regularity of minimal surfaces available in book form. This long-awaited book is a timely and welcome addition to the mathematical literature.

A Survey on Classical Minimal Surface Theory William

Meeks, Joaquín Pérez, 2012 Meeks and Perez present a survey of recent spectacular successes in classical minimal surface theory. The classification of minimal planar domains in three-dimensional Euclidean space provides the focus of the account. The proof of the classification depends on the work of many currently active leading mathematicians, thus making contact with much of the most important results in the field. Through the telling of the story

of the classification of minimal planar domains, the general mathematician may catch a glimpse of the intrinsic beauty of this theory and the authors' perspective of what is happening at this historical moment in a very classical subject. This book includes an updated tour through some of the recent advances in the theory, such as Colding-Minicozzi theory, minimal laminations, the ordering theorem for the space of ends, conformal structure of minimal surfaces, minimal annular ends with infinite total curvature, the embedded Calabi-Yau problem, local pictures on the scale of curvature and topology, the local removable singularity theorem, embedded minimal surfaces of finite genus, topological classification of minimal surfaces, uniqueness of Scherk singly periodic minimal surfaces, and outstanding problems and conjectures.

Minimal Weak Truth Table Degrees and Computably Enumerable Turing Degrees Rodney G. Downey, Keng Meng Ng, Reed Solomon, 2020-09-28

First, there are sets with minimal weak truth table degree which bound noncomputable computably enumerable sets under Turing reducibility. Second, no set with computable enumerable Turing degree can have minimal weak truth table degree. Third, no Δ^0_2 set which Turing bounds a promptly simple set can have minimal weak truth table degree.

A Course in Minimal Surfaces Tobias Holck Colding, William P. Minicozzi II, 2024-01-18 Minimal surfaces date back to Euler and Lagrange and the beginning of the calculus of variations. Many of the techniques developed have played key roles in geometry and partial differential equations. Examples include monotonicity and tangent cone analysis originating in the regularity theory for minimal surfaces, estimates for nonlinear equations based on the maximum principle arising in Bernstein's classical work, and even Lebesgue's definition of the integral that he developed in his thesis on the Plateau problem for minimal surfaces. This book starts with the classical theory of minimal surfaces and ends up with current research topics. Of the various ways of approaching minimal

surfaces (from complex analysis, PDE, or geometric measure theory), the authors have chosen to focus on the PDE aspects of the theory. The book also contains some of the applications of minimal surfaces to other fields including low dimensional topology, general relativity, and materials science. The only prerequisites needed for this book are a basic knowledge of Riemannian geometry and some familiarity with the maximum principle.

The Mechanisms Underlying the Human Minimal Self Verena V. Hafner, Bernhard Hommel, Ezgi Kayhan, Dongheui Lee, Markus Paulus, Stephan Alexander Verschoor, 2022-07-29

Clinical Work and General Management of a Standard Minimal-Resource Facility Musa Touray, Aisha Touray, 2021-10-03 Access to approved scientific medical literature is vital in the context of providing standard, evidence-based health care. Despite the abundance of medical information, ensuring that it is available to health care professionals in the field remains a challenge. Remote areas in economically disadvantaged sub-Saharan Africa often lack internet facilities or reference libraries. At the same time, the long-term storage of books and other documents is a problem due to climatic factors such as humidity and heat, the presence of pests like insects and rodents, as well as environmental hazards and the lack of trained staff to adequately manage, maintain and distribute literary material. Against this background and based on practical experience, this book compiles a series of common disease management protocols adapted for minimal-resource facilities, formulas for national healthcare schemes (vaccination, antenatal, child care) and other useful documents that can facilitate effective hospital management in low-resource countries. Primarily intended for healthcare workers in The Gambia and other nations with a

similar socio-economical background, the book is also a valuable resource for international students and healthcare workers from regions like Europe and the Americas intending to do internships in economically underprivileged geographic areas.

Replacement Models with Minimal Repair Lotfi Tadj,M.-Salah Ouali,Soumaya Yacout, Daoud Ait-Kadi, 2011-03-31 Replacement Models with Minimal Repair is a collection of works by several well-known specialists on the subject of minimal repair in replacement policies. It gives an exhaustive list of minimal repair models for the effective planning of minimal repair and maintenance actions. Written in an engaging style, Replacement Models with Minimal Repair balances complex mathematical models with practical applications. It is divided into six parts that cover: mathematical modeling of minimal repair; preventive maintenance models and optimal scheduling of imperfect preventive maintenance activities; a new warranty servicing strategy with imperfect repair; mathematical models combining burn-in procedure and general maintenance policies; methods for parameters' estimation of minimal repair models; and product support. Replacement Models with Minimal Repair is for anyone with an interest in minimal repair and its impact on maintenance policies and strategies. It is a particularly useful resource for researchers, practitioners, and graduate students.

Minimal Cells: Design, Construction, Biotechnological Applications Alvaro R. Lara,Guillermo Gosset, 2019-12-04 This book provides a comprehensive overview of the design, generation and characterization of minimal cell systems. Written by leading experts, it presents an in-depth analysis of the current issues and challenges in the field, including recent advances in the generation and characterization of reduced-genome strains generated from model organisms with relevance in biotechnology, and basic research such as Escherichia coli, Corynebacterium glutamicum and yeast. It also discusses methodologies, such as bottom-up and top-down genome minimization strategies, as well

as novel analytical and experimental approaches to characterize and generate minimal cells. Lastly, it presents the latest research related to minimal cells of several microorganisms, e.g. *Bacillus subtilis*. The design of biological systems for biotechnological purposes employs strategies aimed at optimizing specific tasks. This approach is based on enhancing certain biological functions while reducing other capacities that are not required or that could be detrimental to the desired objective. A highly optimized cell factory would be expected to have only the capacity for reproduction and for performing the expected task. Such a hypothetical organism would be considered a minimal cell. At present, numerous research groups in academia and industry are exploring the theoretical and practical implications of constructing and using minimal cells and are providing valuable fundamental insights into the characteristics of minimal genomes, leading to an understanding of the essential gene set. In addition, research in this field is providing valuable information on the physiology of minimal cells and their utilization as a biological chassis to which useful biotechnological functions can be added.
