## **Operational guide using the web-based dashboard**

,2020-04-30 Currently, dengue fever is the fastest-spreading mosquito-borne viral disease worldwide with epidemics overburdening stretched health systems and threatening the stability of societies. Although the transmission of dengue and recently also of chikungunya and Zika can be controlled with a combination of effective vector control interventions and an efficient vaccine, late detection and inadequate response mechanisms are compounding the effects of rapid transmission. Furthermore, despite the existence of outbreak alert indicators, the means of deploying them in early warning systems is often lacking. This guide is an update to the previous version. This revised edition of The Early Warning and Response System (EWARS) for Dengue Outbreaks: operational guide using the web-based dashboard aims to provide programme managers with a user-friendly tool that can: (i) analyse and draw conclusions from historic dengue, chikungunya and Zika datasets; (ii) identify appropriate alarm indicators that can sensitively and specifically predict forthcoming outbreaks at smaller spatial scales; and (iii) use these results and analyses to build an early warning system to detect dengue outbreaks in real-time and respond accordingly. Together, these three components will build technical capacity and provide a standardized methodology for predicting dengue outbreaks in countries with great need. Furthermore, this web-based EWARS tool can ensure enhanced, fast and secured communication, between national and subnational

levels, and standardized utilization of surveillance data.
