Guidelines for African swine fever (ASF) prevention and control in smallholder pig farming in Asia Ho, H.P.J., Bremang, A., Conan, A., Tang, H., Oh, Y., Pfeiffer, D.U.,2022-05-10 This document aims to provide guidance for government officials in: Defining surveillance objectives Establishing ASF-related case definition and reporting criteria Providing examples of potential ASF surveillance methods Identifying various crucial factors in consideration of a surveillance system Evaluating a surveillance system Since its incursion to Asia and the Pacific region, African swine fever (ASF) has shown impacts on food security and economics as the virus is expanding towards more areas and countries in the region. As the disease continues to expand into new territories, preparedness and control activities need to be constantly adjusted to adapt to situations observed in the field that may be contrary to what was expected based on international standards or experiences from other parts of the world. This surveillance guideline provides guidance for government officials in defining surveillance objectives, establishing ASF-related case definitions and reporting criteria, providing examples of potential ASF surveillance methods, identifying various crucial factors in consideration of a surveillance system, and evaluating a surveillance system.

Guidelines for African swine fever (ASF) prevention and control in smallholder pig farming in Asia Bremang, A., Ho, HPJ., Conan, A., Tang, H., Oh, Y., Pfeiffer, D.U.,2022-05-10 African swine fever (ASF) is a highly fatal infectious disease of domestic and wild pigs of all breeds and ages with no effective vaccine or treatment. The incursion of ASF into Asia and the Pacific region has been a major concern as the region is the major pig production area, which produces over 58 percent of pigs globally (FAOSTAT). The concerns, therefore, are growing for its impacts on food security and economics as the virus is expanding towards more areas and countries in the region. As the disease continues to expand into new territories, preparedness and control activities need to be constantly adjusted to adapt to situations observed in the field that may be contrary to what was expected based on international standards or experiences from other parts of the world. National veterinary services face challenges in these complex situations, and so regional and international support is needed to fill capacity gaps required for ASF control and to facilitate dialogue among key stakeholders. Through various regional and national consultation meetings, affected countries have requested technical support to make available relevant technical guidelines for ASF control that are practical especially for smallholder pig farmers in the context of Asia (SO5). This Farm biosecurity, slaughtering and restocking] is the third of the series of the “Guidelines for African swine fever (ASF) prevention and control in smallholder pig farming in Asia” which guides biosecurity, slaughtering and restocking practice in smallholder pig farming system which are designed for use by national and/or central veterinary authorities, farmers and relevant stakeholders, especially focusing on Southeast Asian pig industry.

African Swine Fever in wild boar Food and Agriculture Organization of the United Nations,2019-09-11 The purpose of document is to provide fact based overview of ASF ecology in the Northern and Eastern European populations of wild boar and briefly describe a range of practical management and biosecurity measures or interventions, which can help stockholders in the countries experiencing large scale epidemic of this exotic disease to address the problem in a more coherent, collaborative and comprehensive way. The handbook should not be viewed as an authoritative manual providing readymade solutions on how to eradicate ASF from wild boar. The facts, observations and approaches described in the document are presented with the intention to broadly inform veterinary authorities, wildlife conservation bodies, hunting community, farmers and general public about complexity of this novel disease and the need to wisely plan and carefully coordinate any efforts aiming at its prevention and control.

African Swine Fever Yechiel Becker,2011-09-30 African swine fever (ASF) is caused by a virus that is classified as a member of the Iridovirinae family. The disease in the warthog, the natural host, in

Africa was described in 1921 by R. E. Montgomery. The reservoir of the virus is intact. The introduction of domestic pigs into territory occupied by warthogs infected with ASF in the 1960's has endangered the pig industry around the world. The domestic pig is highly sensitive to ASF and develops a devastating disease that kills the pig without giving the immune system a chance to defend the animal against the virus infection. The ability of ASF virus to infect and destroy cells of the reticuloendothelial system leaves a defenseless host that succumbs to an infection which may be described as an acquired immune deficiency disease of domestic pigs. Introduction of the virus into Iberia in the 1960's led to a series of ASF epidemics in Spain and Portugal . . and later in France, that caused heavy economic losses. Between 1976 and 1980, ASF virus made its appearance in Malta and Sardinia . . as well as in Brazil, The Dominican Republic . . Haiti, and later in Cuba. In 1985-6 . . ASF appeared in Belgium and The Netherlands.

Recognizing African Swine Fever Mary-Louise Penrith, David Nyakahuma, Food and Agriculture Organization of the United Nations, 2000 African swine fever (ASF) is endemic in some parts of eastern and southern Africa. The introduction of ASF into free areas leads to losses because of the devastating effects it causes. In order to minimize these losses, it is essential that there is a strong early warning and early reaction capacity. The key to such a system is disease recognition. The purpose of this manual is to enhance recognition of ASF at all levels for early warning and early reaction, so that the disease can be identified and eliminated at its earliest appearance in any area. Special attention has been given to the clinical, anatomical and pathological similarity of African swine fever with classical swine fever.

African swine fever prevention, detection and control in resource-limited settings Food and Agriculture Organization of the United Nations, 2023-09-19 This booklet provides guidance on prevention, detection and control of African swine fever (ASF) in resource-limited settings. It is designed primarily for places where ASF is endemic with few or no prospects of eliminating the disease, and places at high risk of incursion. The guide is divided into five sections. The first covers key aspects of the disease that can be exploited when developing prevention and control programmes, even when resources are limited. The next three sections provide suggestions on simple, low-cost measures for ASF prevention, early warning and detection, and control that have been shown to work in these settings. The last section considers ways that communities can work together to manage ASF, as well as the role of public-private partnerships in this process. Animal health is not just the responsibility of government veterinary services or individual producers. It also involves local communities, feed suppliers, pig traders and processors, and animal health workers at community level. By working together, with the help of the knowledge contained in this guide, we can ensure that the devastation caused by ASF can be minimized, even in places where resources to prevent and control the disease are scarce.

Clean chain approach for African swine fever in smallholder settings Kim, Y., Conan, A., Bremang, A., Tang, H., Oh, Y., Pfeiffer, D.U., 2022-05-05 African swine fever (ASF) is a highly fatal infectious disease of domestic and wild pigs with no effective vaccine or treatment. The incursion of ASF into Asia and the Pacific region has been a major concern as the region is the major pig production area, which produces over 58 percent of pigs globally (FAOSTAT). Through various regional and national consultation meetings, affected countries have requested technical relevant technical guidelines for ASF control that are practical especially for smallholder pig farmers in the context of Asia (SO5). This volume is the fourth of the series of the "Guidelines for African swine fever (ASF) prevention and control in smallholder pig farming in Asia" which outlines the principles of an ASF clean-chain system for smallholder pig producers in Southeast Asia. It provides recommendations on the practical application of good biosecurity management practices combined with traceability in smallholder pig systems necessary

for the continued production and supply of commodities along the pork value chain irrespective of the prevailing ASF virus risk situation.

Understanding and Combatting African Swine Fever Laura Iacolina,Mary-Louise Penrith,Silvia Bellini,Erika Chenais,Ferran Jori,Maria Montoya,Karl Ståhl,Dolores Gavier-Widén,2021-03-15 The recent introduction and spread of African swine fever (ASF) into Europe and Asia has shown that an integrated, multidisciplinary effort is needed to tackle this disease and the complex challenges it poses. This book presents practical guidelines on surveillance for detection of ASF virus, how to prevent outbreaks in the domestic pig sector through biosecurity and cleaning and disinfection routines, including in backyard holdings, and how to control and eradicate this disease in wild boar. Information on pathological lesions and diagnostic practices are provided to support practitioners. Virus infection mechanisms and the consequent host immune response are reported together with an overview on the status of vaccine and treatment development. Information on ASF epidemiology and the European wild boar and domestic pig populations is presented to assist breeders, wildlife managers and policy makers in designing practices aimed at preventing, or controlling and eradicating, this disease. The book provides currently available knowledge in a single place, and identifies knowledge gaps, prompting policy makers and funding bodies to support the scientific community in investigating the gaps.

The rising costs of animal-source foods in Ethiopia: Evidence and implications Bachewe, Fantu Nisrane,Minten, Bart,Yimer, Feiruz,2017-08-11 In many developing countries in which staple foods dominate the composition of diets, higher consumption of animal-source foods (ASF) is associated with significant nutritional benefits. Given the importance of prices for consumption decisions in these settings, we analyze ASF price patterns in the last decade (2007-2016), relying on a large-scale price dataset collected in 116 urban retail markets in Ethiopia. We document important seasonal and spatial patterns and we find, worryingly, that real prices of ASF have been increasing in the last decade by between 32 to 36 percent for three major ASF – milk, eggs, and meat. Similar price

increases are noted in rural and urban areas and for tradable and non-tradable ASFs. This price trend is in contrast with staple cereals for which real prices stayed at similar levels over the last decade. As we estimate that a price increase of this magnitude would reduce consumption of ASF by approximately 25 percent, holding other things constant, it seems that more investments and attention to the production of ASF and the livestock sector are needed to reduce ASF prices and increase their consumption in Ethiopia.

A risk assessment for the introduction of African swine fever into the Federated States of Micronesia Subharat, S., Hee Han, J., Cogger, N.,2022-08-06 This report describes a risk assessment mission in the Federated States of Micronesia, undertaken by the EpiCentre, School of Veterinary Sciences, Massey University, and the Food and Agriculture Organization of the United Nations (FAO) under FAO Technical Cooperation Programme (TCP/SAP/3801). The overall aim was to evaluate the risk of introducing the African swine fever virus (ASFV) into the Federated States of Micronesia and use the findings to propose recommendations that enable professionals, communities and key stakeholders to implement prevention and mitigation measures to reduce the impacts of African swine fever (ASF) incursion. ASF is a highly contagious viral disease of domestic and wild pigs. It has emerged from Africa, spreading to eastern Europe, China and Southeast Asia. Due to ASF outbreaks in Asia and Papua New Guinea, Pacific Islands countries now prioritise preventing the introduction of ASF. A risk assessment of ASFV introduction is necessary for deciding which preventive actions would be most effective. The assessment of risk was conducted using the OIE import risk analysis framework. The most likely pathway for introducing ASFV into the Federated States of Micronesia was importing unauthorised pork products that international arrival passengers may bring in via airport or seaport. Should infected products enter the Federated States of Micronesia, there is a distinct pathway for exposure because pigs are routinely fed food scraps (swill) from households. The likelihood of transmission of ASFV to other susceptible pigs was considered extremely high due to the lack of farm biosecurity and the presence of feral pigs. The assessment method was a systematic, qualitative import risk analysis of ASFV introduction to the Federated States of Micronesia. Results provide information about high-risk areas for ASF introduction, exposure and spread in FSM. They also identify gaps in control and prevention measures. The following steps are being proposed to minimise the likelihood of entry and exposure and the consequence of ASFV introduction.
