Blood Alcohol Concentrations as Affected by Combinations of Alcolic Beverage Dosages and Altitudes E. Arnold Higgins,1970

Effects of Moderate Blood Alcohol Levels on Automobile Passing Behavior William O. Light, Charles G. Keiper, 1971 Sixteen clinically normal individuals .drove in an optical driving simulator in both a non-alcohol and an alcohol condition. In both the 0 mg% (.00%) and the 90 mg% (.09%) blood alcohol level conditions, each subject was given 60 trials in which he was required to make and execute a decision to pass or to continue following a lead car. Times available to safely complete a pass and vehicle speeds were presented in a random manner. During the alcohol condition, subjects not only attempted and completed significantly more passes but also experienced more accidents. Results of this experiment suggest that the effects of moderate levels of blood alcohol must be examined not only as they affect perceptual motor skills, but also as they may more subtly affect risk-taking behavior and decision processes involved in operating a motor vehicle.

Forensic Issues in Alcohol Testing Steven B. Karch, MD, FFLM, 2016-04-19 Extracted from the Drug Abuse Handbook, 2nd edition, to give you just the information you need at an affordable price. Forensic Issues in Alcohol Testing offers concise and focused information specific to the interests of forensic scientists and clinical and forensic toxicologists. It analyzes the acute effects of alcohol intoxication and the methods by which investigators can measure alcohol concentration in blood, urine, and breath. It considers extenuating circumstances affecting acute impairment by detailing the disposition and fate of alcohol in the body as well as the factors influencing absorption, distribution, and elimination. Specific chapters address difficulties in measuring and interpreting post-mortem alcohol concentrations due to poor quality of specimen, sampling site differences, and post-mortem diffusion or synthesis. Recent advances in biochemical testing make it possible to quantitate chronic alcohol ingestion, and the book analyzes the efficacy of these tests as evaluators of dependence or potential for dependence.

Effects of Moderate Blood Alcohol Levels on Driver Alertness Charles G. Keyser, 1972 In this study of the effects of moderate blood alcohol levels (65 mg.%= .065%) on driver alertness, clinically normal individuals drove in an optical driving simulator for uninterrupted periods of 2 hours. During the alcohol session, subjects exhibited significantly slower reaction times, and indicated additional deleterious effects of the alcohol upon performance capacity. Results of this study suggest that the effects of moderate levels of blood alcohol must be examined not only as they affect simple perceptual-motor skills, but also as they may more subtly affect time-sharing capabilities and the various complex decision-reaction processes involved in operating a motor vehicle.

Setting Limits, Saving Lives ,1997 Impaired driving is the most frequently committed violent crime in America. Every 30 minutes, someone in this country dies in an alcohol-related crash. There are four key laws that have been proven effective in the fight against impaired driving: illegal per se, administrative license revocation, zero tolerance, and .08 BAC. This booklet describes the .08 BAC law, and makes the case for adopting it in every state. At .08 BAC, all drivers, even experienced ones, show impairment in driving ability.

Minnesota's Double-barrelled Implied Consent Law Forst Lowery, 1984 To ensure that a driver's license is revoked promptly when a test shows an alcohol concentration of 0.10 or more, regardless of court outcome or plea bargaining on the criminal charge, Minnesota adopted an administrative revocation law 1976, adding to the conventional implied consent revocation for refusing to take the test. This law was unique to Minnesota until 1981 when two other jurisdictions passed similar laws. In 1982 three more, and in 1983 thirteen more states established similar prompt revocation on test result systems. The author describes the Minnesota law as amended in 1982 and discusses legal and constitutional issues. Effect on apprehension rates, swiftness of sanction, deterrence and perceived risk are analyzed. The author concludes that a two-track DWI control system employing both prompt administrative driver license sanctions on one track and conventional court action on a related but not directly connected parallel criminal track enhances deterrence through more certain, swift penalty, perceived by drivers as severe.
