Technology, Social Change and Human Behavior Cornelia C. Walther,2021-04-08 This book looks at the changing continuum that links individuals, communities and society. An outline of Aspirational Algorithms (AA) and Valuable Wearables is presented as tools to shift from an AI culture to the cultivation of Augmented Humanity (AH). The human mindset that is behind the design and use of technology determines the outcomes of technology. If the intended outcome is the common good, then the preceding human aspiration must be geared toward that goal. Only technology that is conceived with the aspiration of a society that lifts individuals to fulfill their potential can be a game-changer for good. Seeing the constant interplay between the four levels of human existence – soul, heart, mind, body, expressed as aspirations, emotions, thoughts and sensations, how technology may serve to systematically sway individuals from inspiration to desire, from informing to the ignition of tangible transformation. This transition is explained in the book along the scale of influence. Two convergent and mutually influencing dynamics are analyzed: first, the influence of values and aspirations on the impact of technology, and second, the influence of technology on the attitude and action of users. Both assess how hardware and software can serve a maximum of people to live a meaningful happy life.

Smart Change Art Markman, PhD,2015-01-06 An insightful guide that shows how habits of behavior are formed, and how we can transform bad habits into positive behaviors in ourselves and others. Smart Change explores the psychological mechanisms that form and maintain habits in individuals and groups and offers real, accessible and actionable advice for changing habits. In an engaging narrative, Markman covers a wide range of habits, from individual behaviors like eating better and exercising regularly to work-related behaviors such as learning effectively and influencing customers' purchases. He proposes that there are five effective tools to help individuals change behavior and to help people influence the habits of the people around them: 1. Tame the "Go" system: Identify the triggers of habits, replace old behaviors with new ones and generate specific plans to deal with obstacles. 2. Harness the "Stop" system: Learn to deal with stress and other factors that hinder the development of new and positive habits. 3. Optimize your goals. Determine the course of behavior change and how to successfully incorporate those changes for the long term. 4. Manage your environment: Change your surroundings to dramatically reduce poor behavior and habits. 5. Engage your Neighbors: To affect other people's behavior, understand the shared culture that creates a mutual dependency, and allows neighbors and colleagues to have a profound positive influence on the behavior of other members of their community.

Software Engineering Andrea de Lucia,Filomena Ferrucci,2009-01-22 Software engineering is widely recognized as one of the most exciting, stimulating, and profitable research areas, with a significant practical impact on the software industry. Thus, training future generations of software engineering researchers and bridging the gap between academia and industry are vital to the field. The International Summer School on Software Engineering (ISSSE), which started in 2003, aims to contribute both to training future researchers and to facilitating the exchange of knowledge between academia and industry. This volume constitutes a collection of articles originating from tutorial lectures given during the last three ISSSE summer schools, as well as a number of contributions on some of the latest findings in the field of software engineering. The book is organized in three parts on software requirements and design; software testing and reverse engineering; and management.

Software Engineering - ESEC '95 Wilhelm Schäfer,Pere Botella,1995-09-13 This book constitutes the proceedings of the 5th European Software Engineering Conference, ESEC '95, held in Sitges near Barcelona, Spain, in September 1995. The ESEC conferences are the premier European platform for the discussion of academic research and industrial use of software engineering technology. The 29 revised full papers were carefully selected from more than 150 submissions and address all current aspects of relevance. Among the topics covered are business process (re-)engineering, real-time, software metrics, concurrency, version and configuration management, formal methods, design process, program analysis, software quality, and object-oriented software development.

Requirements Targeting Software and Systems Engineering M. OnalBroy,Manfred Broy,Bernhard Rumpe,1998-11-04 Software engineering research has different profiles in Europe and North America. While in North America there is a lot of know-how in the practical, technical, and organizational aspects of software engineering, in Europe the work concentrates more on foundations and formal modeling of software engineering issues. Both approaches have their individual strengths and weaknesses. Research driven solely by practice in software engineering runs in the danger of developing into a shallow field failing to find a solid scientific basis or to contribute substantially to the progress in software engineering. Work concentrating on formal aspects alone is in the danger of becoming too theoretical and isolated from practice so that any transfer into practical application will fail. Substantial progress in software engineering can be achieved, however, by bringing together pragmatic and foundational work in software engineering - search. This can provide a step towards a common scientific basis for software engineering that allows us to integrate the various research results, leading to fruitful synergetic effects. It will also help to identify critical research paths and to develop an adequate paradigm for the scientific discipline of software engineering. In software and systems engineering it is necessary to distinguish the enormous difference between the dynamics in development we refer to and the limited scope assumed by many of today's software managers who still use outdated techniques. Many of the unsolved problems associated with the old techniques are symptoms of a lack of formalization and a lack of automation support. It was the goal of this workshop to bring together experts from science and practice in software and systems engineering from North America and Europe.
