The Years of The Switch and The Dream of The Singularity Joe Gancio-Mego, The main theory in this book is the fact that humans as a species have stopped evolving in-vivo. They are evolving in-caput. It means that humans by developing technology turn themselves into a never ending list of sub-species. The dynamics of in-caput evolution are modelled in Julia and described in detail in this book. All equations are described and Julia code listings are present in this book. The conclusions coming from those equations are the following: We have seen that “in caput evolution” can define the way by which the homo sapiens species operates. Defining with allometric equations, the “in caput evolution” is possible. In that case, the most plausible equation models succeed in defining the current humanity s-curve, with a time extension from -2000 CE to 6000 CE. All of a sudden, the current s-curve became visible. It is the technology that fuels this “in caput evolution” s-curve. The technology level allows us to predict the human population during the s-curve and the human lifespan. Interestingly the quarter-power law, so crucial in allometry, stay the course also in this case. If we believe in those equations, then the corresponding s-curves of the human population and technology level went through their maximum growth points during the last few decades. Therefore we have switched from growing growth to decreasing growth. Those were the years of the switch for this s-curve that can be defined as “the technarian age jump”. It is possible to plot factor population function of the technology level

factor, which shows the functional response of humanity during the technarian age jump. It usually is not easy to diverge a lot from a functional response. But there are two sides to the functional response. One is the crowded side. Where there is more population and fewer resources, the other side is the smart side. They both go to the same point, but one side is the smarter and safer side. In front of factor population and factor technology level, it is possible to extend the definition of species fitness beyond simply the factor population but also the factor technology level into it. Life is a succession of s-curves reversely falling into negentropy. Before the technarian age jump s-curve, humanity went through the venatorian s-curve and the agrarian s-curve. Simplified models of venatorian, agrarian and technarian societies have been done to evaluate if dynamic societal movements could impact the main s-curve. But societal movements likely have only a limited impact on the overall humanity functional response. However, there has been an exciting result modelling the agrarian society. It appears that its well-documented plural centenarian instability cycle might actually be generated by elite over reproduction but also end especially by the elite loss of efficiency. The discovered allometry equations enable us to estimate that humans are right now the equivalent of a 98% material aggregation and 2% molecular aggregation. At the end of the technarian s-curve, they will be 99.5% material and 0.5% molecular. That is if nothing changes. But things will change. The new s-curve is getting started. It will be the one of The Singularity. It is unknown when and how it will play out. It is unknown if in the middle there will be a long or very long asymptotic phase, but it will be a crucially important and exciting time. Hopefully, humanity will fulfil its destiny of being a “Proteromononic” species.

Impact of the concept of shared value (SV) on developing countries (Creating Shared Value) Frank Machens, 2015-02-01 First published in the key article ‘The Big Idea: ‘Creating Shared Value’ ’ by KRAMER and PORTER, the Concept of Creating Shared Value (CSV) describes a new approach in the relation between companies and societal needs. The implementation of this Concept in Developing Countries appears to be particular promising. This Thesis is giving exact definitions of relevant terms as ‘Developing Country’, CSV and the related Concept of Corporate Social Responsibility (CSR). Hereby, CSV itself is getting initially and critically discussed. Following is the fundamental methodical instrument, the Case Studies. Three well-chosen CSV-projects are analysed and their impact on the affected Developing Countries is displayed. Eventually, the key advantages of CSV in this particular field are highlighted, but also relevant questions concerning the competitiveness of CSV are raised.

Python for Bioinformatics Sebastian Bassi, 2016-04-19 Programming knowledge is often necessary for finding a solution to a biological problem. Based on the author's experience working for an agricultural biotechnology company, Python for Bioinformatics helps scientists solve their biological problems by helping them understand the basics of programming. Requiring no prior knowledge of programming-related concepts, the book focuses on the easy-to-use, yet powerful, Python computer language. The book begins with a very basic introduction that teaches the principles of programming. It then introduces the Biopython package, which can be useful in solving life science problems. The next section covers sophisticated tools for bioinformatics, including relational database management systems and XML. The last part illustrates applications with source code, such as sequence manipulation, filtering vector contamination, calculating DNA melting temperature, parsing a genbank file, inferring splicing sites, and more. The appendices provide a wealth of supplementary information, including instructions for installing Python and Biopython and a Python language and style guide. By incorporating examples in biology as well as code fragments throughout, the author places a special emphasis on practice, encouraging readers to experiment with the code. He shows how to use Python and the Biopython package for building web applications, genomic annotation, data manipulation, and countless other applications.

Statistical Computing with R Maria L. Rizzo, 2007-11-15 Computational statistics and statistical computing are two areas that employ computational, graphical, and numerical approaches to solve statistical problems, making the versatile R language an ideal computing environment for these fields. One of the first books on these topics to feature R, Statistical Computing with R covers the traditional core material of computational statistics, with an emphasis on using the R language via an examples-based approach. Suitable for an introductory course in computational statistics or for self-study, it includes R code for all examples and R notes to help explain the R programming concepts. After an overview of computational statistics and an introduction to the R computing environment, the book reviews some basic concepts in probability and classical statistical inference. Each subsequent chapter explores a specific topic in computational statistics. These chapters cover the simulation of random variables from probability distributions, the visualization of multivariate data, Monte Carlo integration and variance reduction methods, Monte Carlo methods in inference, bootstrap and jackknife, permutation tests, Markov chain Monte Carlo (MCMC) methods, and density estimation. The final chapter presents a selection of examples that illustrate the application of numerical methods using R functions. Focusing on implementation rather than theory, this text serves as a balanced, accessible introduction to computational statistics and statistical computing.
