Improving Diagnosis in Health Care National Academies of Sciences, Engineering, and Medicine, Institute of Medicine, Board on Health Care Services, Committee on Diagnostic Error in Health Care, 2015-12-29

Getting the right diagnosis is a key aspect of health care - it provides an explanation of a patient's health problem and informs subsequent health care decisions. The diagnostic process is a complex, collaborative activity that involves clinical reasoning and information gathering to determine a patient's health problem. According to *Improving Diagnosis in Health Care*, diagnostic errors-inaccurate or delayed diagnoses-persist throughout all settings of care and continue to harm an unacceptable number of patients. It is likely that most people will experience at least one diagnostic error in their lifetime, sometimes with devastating consequences. Diagnostic errors may cause harm to patients by preventing or delaying appropriate treatment, providing unnecessary or harmful treatment, or resulting in psychological or financial repercussions. The committee concluded that improving the diagnostic process is not only possible, but also represents a moral, professional, and public health imperative. *Improving Diagnosis in Health Care*, a continuation of the landmark Institute of Medicine reports *To Err Is Human* (2000) and *Crossing the Quality Chasm* (2001), finds that diagnosis-and, in particular, the occurrence of diagnostic errors-“has been largely unappreciated in efforts to improve the quality and safety of health care. Without a dedicated focus on improving diagnosis, diagnostic errors will likely worsen as the delivery of health care and the diagnostic process continue to increase in complexity. Just as the diagnostic process is a collaborative activity, improving diagnosis will require collaboration and a widespread commitment to change among health care professionals, health care organizations, patients and their families, researchers, and policy makers. The recommendations of *Improving Diagnosis in Health Care* contribute to the growing momentum for

change in this crucial area of health care quality and safety.

Diagnostic Hematology Doyen Nguyen, Lawrence Diamond, 2000-06-05 Diagnostic hematology is a problem-solving process involving the gathering and analysis of the relevant findings in each case. Based on the combination of clinical and laboratory data, an experienced diagnostician can formulate the overall 'pattern' of a case. The 'pattern approach' to differential diagnosis is an integral component of the diagnostic reasoning of many expert hematologists. In this unique textbook the authors present a logical and systematic approach to diagnosis, based on the patterns derived from peripheral blood analysis, flow cytometry immunophenotyping studies and bone marrow examination. Unlike standard textbooks which are organized by specific diseases and thereby assume the reader has reached a diagnosis, this text presents the diagnostic problem as it is investigated in practice.

The patterns formed by different blood and bone marrow disorders are described in detail and illustrated with color photomicrographs, or flow cytometry graphics. The reader is taken through the process of reaching the differential diagnosis. Advice is given on the proper approach to diagnostic work-up and how to avoid common diagnostic pitfalls. The companion CD-ROM, with full instructions given in the appendix, offers the reader the chance to assess real test results, and see the patterns which lead to the final interpretation in over 200 cases. As a result the reader will develop the skill of pattern recognition and be able to incorporate this diagnostic approach in practice. This is an essential text for physicians practicing hematology and hematopathology, especially those interpreting peripheral blood, flow cytometry and bone marrow specimens; also for technologists and laboratory staff responsible for the screening of full blood counts, the initial review of blood/bone marrow films or immunophenotyping data. System requirements: Windows 95, Windows 98 or Windows NT. Screen resolution of 800 x 600 with 16 million colours (24-bit). Minimum display: at least 65,000 colours (16-bit).
