Broader Perspectives on Motion Event Descriptions Yo Matsumoto, Kazuhiro Kawachi, 2020-08-15

Human languages exhibit fascinating commonalities and variations in the ways they describe motion events. In this volume, the contributors present their research results concerning motion event descriptions in the languages that they investigate. The volume features new proposals based on a broad range of data involving different kinds of motion events previously understudied, such as caused motion (e.g., kick a ball across) and even visual motion (e.g., look into a hole). Special attention is also paid to deixis, a hitherto neglected aspect of motion event descriptions. A wide range of languages is examined, including those spoken in Europe, Africa, and Asia. The results provide new insights into the patterns languages deploy to represent motion events. This volume will appeal to anyone interested in language universals and typology, as well as the relationship between language and thought.

Motion and Space across Languages Iraide Ibarretxe-Antuñano, 2017-08-15 This volume offers a unique combination of interdisciplinary research and a comprehensive overview of motion and space studies from a semantic typological perspective. The chapters present cutting-edge research covering central topics such as the status of semantic components in motion event descriptions and their role in typological variation, the function of linguistic multimodal structures for the codification of motion, the diachronic evolution of motion expressions and its effects on motion typologies, the correspondences between physical and non-physical (fictive, metaphorical) motion, and the impact of contexts and genres on the characterization and interpretation of motion events. These issues are examined from a theoretical and applied linguistic perspective (L1–L2 acquisition, translation/interpreting). The analyses make use of diachronic and synchronic data collected by a range of methods (elicitation, experimentation, and corpus research) in more than fifteen languages. All in all, this book will be of great value to scholars and students interested in the expression of motion and space across languages.

A Second Course in Elementary Differential Equations Paul Waltman, 2014-05-10 A Second Course in Elementary Differential Equations deals with norms, metric spaces, completeness, inner products, and an asymptotic behavior in a natural setting for solving problems in differential equations. The book reviews linear algebra, constant coefficient case, repeated eigenvalues, and the employment of the Putzer algorithm for nondiagonalizable coefficient matrix. The text describes, in geometrical and in an intuitive approach, Liapunov stability, qualitative behavior, the phase plane concepts, polar coordinate

techniques, limit cycles, the Poincaré-Bendixson theorem. The book explores, in an analytical procedure, the existence and uniqueness theorems, metric spaces, operators, contraction mapping theorem, and initial value problems. The contraction mapping theorem concerns operators that map a given metric space into itself, in which, where an element of the metric space M , an operator merely associates with it a unique element of M . The text also tackles inner products, orthogonality, bifurcation, as well as linear boundary value problems, (particularly the Sturm-Liouville problem). The book is intended for mathematics or physics students engaged in ordinary differential equations, and for biologists, engineers, economists, or chemists who need to master the prerequisites for a graduate course in mathematics.

Amenable Banach Algebras Volker Runde, 2020-03-03 This volume provides readers with a detailed introduction to the amenability of Banach algebras and locally compact groups. By encompassing important foundational material, contemporary research, and recent advancements, this monograph offers a state-of-the-art reference. It will appeal to anyone interested in questions of amenability, including those familiar with the author's previous volume *Lectures on Amenability*. Cornerstone topics are covered first: namely, the theory of amenability, its historical context, and key properties of amenable groups. This introduction leads to the amenability of Banach algebras, which is the main focus of the book. Dual Banach algebras are given an in-depth exploration, as are Banach spaces, Banach homological algebra, and more. By covering amenability's many applications, the author offers a simultaneously expansive and detailed treatment. Additionally, there are numerous exercises and notes at the end of every chapter that further elaborate on the chapter's contents. Because it covers both the basics and cutting edge research, *Amenable Banach Algebras* will be indispensable to both graduate students and researchers working in functional analysis, harmonic analysis, topological groups, and Banach algebras. Instructors seeking to design an advanced course around this subject will appreciate the student-friendly elements; a prerequisite of functional analysis, abstract harmonic analysis, and Banach algebra theory is assumed.

Liaison, Schottky Problem and Invariant Theory Maria Emilia Alonso, Enrique Arrondo, Raquel Mallavibarrena, Ignacio Sols, 2011-01-30 Federico Gaeta (1923–2007) was a Spanish algebraic geometer who was a student of Severi. He is considered to be one of the founders of linkage theory, on which he published several key papers. After many years abroad he came back to Spain in the 1980s. He spent his last period as a professor at Universidad Complutense de Madrid. In gratitude to him, some of his personal and mathematically close persons during this last station, all of whom benefited in one way or another by his inspiration, have joined to edit this volume to keep his memory alive. We offer in it surveys and original articles on the three main subjects of Gaeta's interest through his mathematical life. The volume opens with a personal semblance by Ignacio Sols and a historical presentation by Ciro Ciliberto of Gaeta's Italian period. Then it is divided into three parts, each of them devoted to a specific subject studied by Gaeta and coordinated by one of the editors. For each part, we had the advice of another colleague of Federico linked to that particular subject, who also contributed with a short survey. The first part, coordinated by E. Arrondo with the advice of R.M.

Recent Developments in Network Theory S. R. Deards, 2014-05-12 Recent Developments in Network Theory presents the proceedings of the symposium on network theory, held at the College of Aeronautics, Cranfield in September 1961. New Perspectives on the Development of Communicative and Related Competence in Foreign Language Education Izumi Walker, Daniel Kwang Guan Chan, Masanori Nagami, Claire Bourguignon, 2018-08-21 Nearly half a century has passed since Hymes proposed the concept of communicative competence to describe the knowledge and skills required for the appropriate use of

language in a social context. During these decades, a number of scholars have applied and refined this concept. In language education, communicative competence has been identified as a major objective of learning. This book will inform readers about communicative competence as a highly complex construct encompassing an array of sub-competencies such as linguistic skills and proficiencies, knowledge of socio-cultural and socio-pragmatic codes, and the ability to engage in textual and conversational discourse. Findings from research in related disciplines have pointed to the significance of factors that can contribute to the attainment of communicative competence. Various teaching practices and relevant Information and Communication Technology (ICT) tools will be also introduced and discussed to achieve communicative competence as a complex ability. It is a timely contribution to current research on key areas in the teaching, learning and acquisition of second/foreign languages.

Teachability and Learnability across Languages Ragnar Arntzen,Gisela Håkansson,Arnstein Hjelde,Jörg-U. Keßler,2019-06-15 *Teachability and Learnability across Languages* addresses key issues in second, foreign and heritage language acquisition, as well as in language teaching. Focusing on a Processability Theory perspective, it brings together empirical studies of language acquisition, language teaching, and language assessment. For the first time, a research timeline for the role of instruction in language learning is presented, showing how the field of second language acquisition (SLA) research has developed over the last four decades since Pienemann's work on learnability and syllabus construction over the 1980s. The book includes studies of child and adult second as well as foreign language acquisition research, covering a wide range of target languages including English, German, Hungarian, Japanese, Norwegian, Polish, Spanish, Swedish, and Turkish. In addition, future extensions of PT are discussed. This volume is designed for advanced students in international programs of SLA and Applied Linguistics as well as for SLA researchers and second and foreign language teachers.

Advances in Magnetic Resonance John S. Waugh,2013-10-22 *Advances in Magnetic Resonance*, Volume 9 describes the magnetic resonance in split constants and dipolar relaxation. This book discusses the temperature-dependent splitting constants in the ESR spectra of organic free radicals; temperature-dependent splittings in ion pairs; and magnetic resonance induced by electrons. The electron impact excitation of atoms and molecules; intramolecular dipolar relaxation in multi-spin systems; and dipolar cross-correlation problem are also elaborated. This text likewise covers the NMR

studies of molecules oriented in thermotropic liquid crystals and diffusion coefficients of the molecules dissolved in liquid crystals. This publication is beneficial to students and researchers interested in split constants and dipolar relaxation.

Covering Dimension of C^ -Algebras and 2-Coloured Classification* Joan Bosa,Nathanial P.

Brown,Yasuhiko Sato,Aaron Tikuisis,Stuart White,Wilhelm Winter,2019-02-21 The authors introduce the concept of finitely coloured equivalence for unital $*$ -homomorphisms between $*$ -algebras, for which unitary equivalence is the $*$ -coloured case. They use this notion to classify $*$ -homomorphisms from separable, unital, nuclear $*$ -algebras into ultrapowers of simple, unital, nuclear, $*$ -stable $*$ -algebras with compact extremal trace space up to $*$ -coloured equivalence by their behaviour on traces; this is based on a $*$ -coloured classification theorem for certain order zero maps, also in terms of tracial data. As an application the authors calculate the nuclear dimension of non-AF, simple, separable, unital, nuclear, $*$ -stable $*$ -algebras with compact extremal trace space: it is 1. In the case that the extremal trace space also has finite topological covering dimension, this confirms the remaining open implication of the Toms-Winter conjecture. Inspired by homotopy-rigidity theorems in geometry and topology, the authors derive a “homotopy equivalence implies isomorphism” result for large classes of $*$ -algebras with finite

nuclear dimension.
