High Performance Memory Testing R. Dean

Adams,2006-04-11 Are memory applications more critical than they have been in the past? Yes, but even more critical is the number of designs and the sheer number of bits on each design. It is assured that catastrophes, which were avoided in the past because memories were small, will easily occur if the design and test engineers do not do their jobs very carefully. High Performance Memory Testing: Design Principles, Fault Modeling and Self Test is based on the author's 20 years of experience in memory design, memory reliability development and memory self test. High Performance Memory Testing: Design Principles, Fault Modeling and Self Test is written for the professional and the researcher to help them understand the memories that are being tested.

The Camden Memory Tests Manual Elizabeth K.

Warrington,1996 One free copy of the manual is sent with each test. This publication is not available to bookshops.

The Camden Memory Tests Elizabeth K. Warrington,1996 The Camden Memory Tests consist of 5 new measures. Each test was developed to fulfil a clinical need that was not met by existing memory tests and they are intended to be used separately. The Pictorial Recognition Memory Test is an exceptionally easy test that can provide useful clinical information in the assessment of patients unable to cope with the demands of more difficult tests. It can also be used to identify subjects who are 'faking' memory disorders. The Topographical Recognition Memory Test provides a culture-free measure of visual memory that is a useful alternative to the more commonly used Recognition Memory Test for faces. The Paired-Associate Learning Test provides a more satisfactory measure of verbal recall and verbal learning than is at present available. The Short Recognition Memory Test for Words and The Short Recognition Memory Test for Faces were both developed to

provide a short and quick version of the standard Recognition Memory Test with only the minimum loss of discriminative power. Each of the 5 individual tests has been standardised in a large representative cross section of an urban population including subjects between the ages of 70 and 85. Validation studies are presented. The localising power of the Topographical Recognition Memory Test and the Paired-Associate Learning Test has been established by assessing patients with unilateral cerebral lesions and the discriminative power of the Short Recognition Memory Test for Words and for Faces has been established by assessing patients with dementing illnesses.

Human Learning and Memory Laura Imperatori, 2014-06-24
Project Report from the year 2012 in the subject Psychology - Learning Psychology, Intelligence Research, grade: A, University of Cambridge (Department of Experimental Psychology), course: Natural Sciences Tripos, language: English, abstract: The Generation-Recognition Theory and the Encoding Specificity Theory that both deliver a process description of human memory were both tested by the Cued Recall & Recognition test - a simplified form of experiments performed by Watkins and Tulving. The Cued Recall & Recognition test was performed on 42 subjects overall and the proportion of words that were recalled, but not recognised, was determined to be 0.27 ± 0.19 . Two different groups were allocated (unknown to the participants) on the basis of the stimulus sets used (stimulus set 1 or 2) to test the influence of the stimulus sets on obtaining the above results. We verified that our results were not likely to be due simply to the specific stimuli that were used but showing a more general effect given that we found $t(40)_{\{0.05\}} = 1.168$ in a two tailed t-test, and, thus, retained $H_{\{0\}}$: ``There is no significant difference in the proportion of words recalled, but not recognised, between the two groups (due to the different stimulus sets used).'' The significant

proportion of words being recalled but not recognised contradicts generation-recognition theory, but supports encoding specificity theory, which argues that retrieval is based on a congruence between how information was encoded (or studied) and how it is accessed at retrieval, hence memory is highly context-dependent and episodic in nature.

Multi-run Memory Tests for Pattern Sensitive Faults Ireneusz Mrozek, 2018-07-06 This book describes efficient techniques for production testing as well as for periodic maintenance testing (specifically in terms of multi-cell faults) in modern semiconductor memory. The author discusses background selection and address reordering algorithms in multi-run transparent march testing processes. Formal methods for multi-run test generation and many solutions to increase their efficiency are described in detail. All methods presented ideas are verified by both analytical investigations and numerical simulations. Provides the first book related exclusively to the problem of multi-cell fault detection by multi-run tests in memory testing process; Presents practical algorithms for design and implementation of efficient multi-run tests; Demonstrates methods verified by analytical and experimental investigations.

DCS Georg Lamberti, Sigrid Weidlich, 1998 The DCS is a learning and memory test for detecting memory deficits resulting from acquired brain damage. Based originally on the work of the psychiatrist F. Hillers, the test has been successfully used now for more than 20 years in German-speaking countries. In this third edition, a parallel form has been developed which allows the course of cerebral disease to be assessed. Test subjects are shown nine symmetrical geometrical drawings in succession which, after being removed, all have to be reproduced with five short sticks.

Six trials are allowed, although the goal of reproducing all drawings in one trial can be reached well before then by some patients. Test performance is dependent upon several factors, such as directing one's attention, and perceiving, storing and reproducing forms. Test results give strong evidence of the learning ability and the performance of visual memory of the test subjects. Used together with the data collected by Weidlich, the test can also be used in the diagnosis of dementia.
