Processing, second edition Casey Reas,Ben Fry,2014-12-19 The new edition of an introduction to computer programming within the context of the visual arts, using the open-source programming language Processing; thoroughly updated throughout. The visual arts are rapidly changing as media moves into the web, mobile devices, and architecture. When designers and artists learn the basics of writing software, they develop a new form of literacy that enables them to create new media for the present, and to imagine future media that are beyond the capacities of current software tools. This book introduces this new literacy by teaching computer programming within the context of the visual arts. It offers a comprehensive reference and text for Processing (www.processing.org), an open-source programming language that can be used by students, artists, designers, architects, researchers, and anyone who wants to program images, animation, and interactivity. Written by Processing's cofounders, the book offers a definitive reference for students and professionals. Tutorial chapters make up the bulk of the book; advanced professional projects from such domains as animation, performance, and installation are discussed in interviews with their creators. This second edition has been thoroughly updated. It is the first book to offer in-depth coverage of Processing 2.0 and 3.0, and all examples have been

updated for the new syntax. Every chapter has been
revised, and new chapters introduce new ways to
work with data and geometry. New "synthesis"
chapters offer discussion and worked examples of
such topics as sketching with code, modularity,
and algorithms. New interviews have been added
that cover a wider range of projects. "Extension"
chapters are now offered online so they can be
updated to keep pace with technological
developments in such fields as computer vision and
electronics. Interviews SUE.C, Larry Cuba, Mark
Hansen, Lynn Hershman Leeson, Jürg Lehni,

  The Word Processing Book Peter McWilliams,1983
  Introduction to Natural Language Processing
Jacob Eisenstein,2019-10-01 A survey of
computational methods for understanding,
generating, and manipulating human language, which
offers a synthesis of classical representations
and algorithms with contemporary machine learning
techniques. This textbook provides a technical
perspective on natural language processing—methods
for building computer software that understands,
generates, and manipulates human language. It
emphasizes contemporary data-driven approaches,
focusing on techniques from supervised and
unsupervised machine learning. The first section
establishes a foundation in machine learning by
building a set of tools that will be used

throughout the book and applying them to word-based textual analysis. The second section introduces structured representations of language, including sequences, trees, and graphs. The third section explores different approaches to the representation and analysis of linguistic meaning, ranging from formal logic to neural word embeddings. The final section offers chapter-length treatments of three transformative applications of natural language processing: information extraction, machine translation, and text generation. End-of-chapter exercises include both paper-and-pencil analysis and software implementation. The text synthesizes and distills a broad and diverse research literature, linking contemporary machine learning techniques with the field's linguistic and computational foundations. It is suitable for use in advanced undergraduate and graduate-level courses and as a reference for software engineers and data scientists. Readers should have a background in computer programming and college-level mathematics. After mastering the material presented, students will have the technical skill to build and analyze novel natural language processing systems and to understand the latest research in the field.

  Transaction Processing Jim Gray,Andreas Reuter,1992-09-30 The key to client/server computing. Transaction processing techniques are deeply ingrained in the fields of databases and operating systems and are used to monitor, control and update information in modern computer systems. This book will show you how large, distributed, heterogeneous computer systems can be made to work reliably. Using transactions as a unifying

conceptual framework, the authors show how to build high-performance distributed systems and high-availability applications with finite budgets and risk. The authors provide detailed explanations of why various problems occur as well as practical, usable techniques for their solution. Throughout the book, examples and techniques are drawn from the most successful commercial and research systems. Extensive use of compilable C code fragments demonstrates the many transaction processing algorithms presented in the book. The book will be valuable to anyone interested in implementing distributed systems or client/server architectures.
