**Computer Use in Psychology** Michael L. Stoloff,James V. Couch,1988 The second edition of Computer Use in Psychology: A Directory of Software is a single volume resource that identifies and describes computer software useful for clinical and academic psychologists. With increasing use of computers in both academic instruction (Couch & Stoloff, 1986, 1988; Stoloff & Couch, 1986, 1987) and professional practice, the present Directory can assist the psychologist in identifying those software packages that best fit their needs. The Directory contains program listings for 883 pieces of software and is divided into four sections. The listings in each section are sorted alphabetically by title. The Academic Software section contains 181 listings that are appropriate for use in psychology instruction. Software in this section is classified by the most likely course in which the particular piece of software would be used. The Clinical and Applied Psychology section contains 121 listings designed for use in the practice of clinical and/or applied psychology. The Statistics and Research section contains 216 listings of software that could be used for data analysis and presentation. The final section, Testing Software, contains 365 listings of software that presents psychological evaluation instruments by means of a computer or aids the test administrator in the scoring and/or interpretation of the instrument. Included in this section are software packages that write reports based upon the results of the psychological instruments. Each software listing in the Directory is standardized. Although the software described in the Directory was identified using several different techniques, these techniques do not reflect a scientific sampling. If individual software packages have been reviewed in a journal or another publication, that review is cited--Introduction. (PsycINFO Database Record (c) 2006 APA, all rights reserved)

*Building Experiments in PsychoPy* Jonathan Peirce,Rebecca Hirst,Michael MacAskill,2022-01-12 PsychoPy is an open-source software package for creating rich, dynamic experiments in psychology, neuroscience and linguistics. Written by its creator, this book walks you through the steps of building experiments in PsychoPy, from using images to discovering lesser-known features, and from analysing data to debugging your experiment. Divided into three parts and with unique extension exercises to guide you at whatever level you are at, this textbook is the perfect tool for teaching practical undergraduate classes on research methods, as well as acting as a comprehensive reference text for the professional scientist. Essential reading for anyone using PsychoPy software, the second edition has been fully updated and includes multiple new chapters about features included in recent versions of PsychoPy, including running studies online and collecting survey data. Part I teaches you all the basic skills you need (and some more advanced tips along the way) to design experiments in behavioral sciences. Each chapter introduces anew concept but will offer a series of working experiments that you can build on. Part II presents more details important for professional scientists intending to use PsychoPy for published research. This part is recommended reading for science professionals in any discipline. Part III covers a range of specialist topics, such as those doing fMRI research, or those studying visual perception. This book fills an incredibly important gap in the field. Many users of PsychoPy will be excited to learn that there is now a highly accessible and well-designed written guide to refine their skills. – Susanne Quadflieg, University of Bristol

*Python for Experimental Psychologists* Edwin S. Dalmaijer,2016-11-03 Programming is an important part of experimental psychology and cognitive neuroscience, and Python is an ideal language for novices. It sports a very readable syntax, intuitive variable management, and a very large body of functionality that ranges from simple arithmetic to complex computing. Python for Experimental Psychologists provides researchers without prior programming experience with the knowledge they need to independently script experiments and analyses in Python. The skills it offers include: how to display stimuli on a computer screen; how to get input from peripherals (e.g. keyboard, mouse) and specialised equipment (e.g. eye trackers); how to log data; and how to control timing. In addition, it shows readers the basic principles of data analysis applied to behavioural data, and the more advanced techniques required to analyse trace data (e.g. pupil size) and gaze data. Written informally and accessibly, the book deliberately focuses on the parts of Python that are relevant to experimental psychologists and cognitive neuroscientists. It is also supported by a companion website where you will find colour versions of the figures, along with example stimuli, datasets and scripts, and a portable Windows installation of Python.

**Designing and Engineering Time** Steven C. Seow Ph.D.,2008-04-29 Build Applications, Websites, and Software Solutions that Feel Faster, More Efficient, and More Considerate of Users' Time! One hidden factor powerfully influences the way users react to your software, hardware, User Interfaces (UI), or web applications: how those systems utilize users' time. Now, drawing on the nearly 40 years of human computer interaction research—including his own pioneering work—Dr. Steven Seow presents state-of-the-art best practices for reflecting users' subjective perceptions of time in your applications and hardware. Seow begins by introducing a simple model that explains how users perceive and expend time as they interact with technology. He offers specific guidance and recommendations related to several key aspects of time and timing—including user tolerance, system responsiveness, progress indicators, completion time estimates, and more. Finally, he brings together proven techniques for impacting users' perception of time drawn from multiple disciplines and industries, ranging from psychology to retail, animal research to entertainment. • Discover how time and timing powerfully impact user perception, emotions, and behavior • Systematically make your applications more considerate of users' time • Avoid common mistakes that consistently frustrate or infuriate users • Manage user perceptions and tolerance, and build systems that are perceived as faster • Optimize “flow” to make users feel more productive, empowered, and creative • Make reasonable and informed tradeoffs that maximize limited development resources • Learn how to test usability issues related to time—including actual vs. perceived task duration Designing and Engineering Time is for every technology developer, designer, engineer, architect, usability specialist, manager, and marketer. Using its insights and techniques, technical and non-technical professionals can work together to build systems and applications that provide far more value—and create much happier users. Steven C. Seow has a unique combination of experience in both experimental psychology and software usability. He joined Microsoft as a User Researcher after completing his Ph.D. in Experimental Psychology at Brown University with a research focus on human timing and information theory models of human performance. Seow holds Bachelor's and Master's Degrees in Forensic Psychology from John Jay College of Criminal Justice, and wrote his master's thesis on distortions in time perception. **MATLAB for Psychologists** Mauro Borgo,Alessandro Soranzo,Massimo Grassi,2012-03-24 The matrix laboratory interactive computing environment—MATLAB—has brought creativity to research in diverse disciplines, particularly in designing and programming experiments. More commonly used in mathematics and the sciences, it also lends itself to a variety of applications across the field of psychology. For the novice looking to use it in experimental psychology research, though, becoming familiar with MATLAB can be a daunting task. MATLAB for Psychologists expertly guides readers through the component steps, skills, and operations of the software, with plentiful graphics and examples to match the reader's comfort level.

Using an extended illustration, this concise volume explains the program’s usefulness at any point in an experiment, without the limits imposed by other types of software. And the authors demonstrate the responsiveness of MATLAB to the individual’s research needs, whether the task is programming experiments, creating sensory stimuli, running simulations, or calculating statistics for data analysis. Key features of the coverage: Thinking in a matrix way. Handling and plotting data. Guidelines for improved programming, sound, and imaging. Statistical analysis and signal detection theory indexes. The Graphical User Interface. The Psychophysics Toolbox. MATLAB for Psychologists serves a wide audience of advanced undergraduate and graduate level psychology students, professors, and researchers as well as lab technicians involved in programming psychology experiments.

*Psychology of Programming* J.-M. Hoc,2014-05-19 Psychology provides a backdrop for most of the study of human\***b1**computer interaction. In this volume the psychological issues that pertain to programming, rather than systems design, are examined in four sections: Theoretical and Methodological Issues; Language Design and Skill Acquisition; Expert Programming; and the Future.\*\*\*\*The book was inspired by working groups in France and the United Kingdom but also includes work by major North American figures (such as Curtis and Soloway). It is the first comprehensive work on this topic since the early 1980s.

*Python for Experimental Psychologists* Edwin S. Dalmaijer,2016-10-18 Programming is an important part of experimental psychology and cognitive neuroscience, and Python is an ideal language for novices. It sports a very readable syntax, intuitive variable management, and a very large body of functionality that ranges from simple arithmetic to complex computing. Python for Experimental Psychologistsprovides researchers without prior programming experience with the knowledge they need to independently script experiments and analyses in Python. It teaches readers the basics of programming in Python, enabling them to go on and program their own experiments. The skills it offers include: how to display stimuli on a computer screen; how to get input from peripherals (e.g. keyboard, mouse etc.) and specialized equipment (e.g. eye trackers); how to log data; and how to control timing. In addition, it shows readers the basic principles of data analysis applied to behavioral data, and the more advanced techniques required to analyse trace data (e.g. pupil size and EEG) and gaze data. Written informally and accessibly, the book deliberately focuses on the parts of Python that are relevant to experimental psychologists and cognitive neuroscientists. It is also accompanied by a companion website where you will find colour versions of the figures, along with example stimuli, datasets and scripts, and a portable Windows installation of Python.

**Quantum Psychology** Robert Anton Wilson,1990 Throughout human history, thoughts, values and behaviours have been coloured by language and the prevailing view of the universe. With the advent of Quantum Mechanics, relativity, non-Euclidean geometries, non-Aristotelian logic and General Semantics, the scientific view of the world has changed dramatically from just a few decades ago. Nonetheless, human thinking is still deeply rooted in the cosmology of the middle ages. This is the book to change your way of perceiving yourself -- and the universe. Some say it's materialistic, others call it scientific and still others insist it's mystical. It is all of these -- and none. The book for the 21st Century, complete with exercises. Picks up where Prometheus Rising left off. Some say it's materialistic, others call it scientific and still others insist it's mystical. It is all of these -- and none.
