Phoenix Project Manager Real World Scheduling

John Buttelwerth (Illustrator), 2015-07-01 Phoenix Real World Scheduling is called real world because the author wrote it drawing upon his 30+ years of experience consulting with contractors to help them meet their construction scheduling software needs. He knows how contractors use scheduling software, what's important to them - and what is not! Phoenix Project Manager is considered by many to be the best replacement for SureTrak. This manual has been tested and retested in both the classroom and the company training room. It will guide you thru the many features of Phoenix Project Manager and teach you how use the software the way contractors use it. Other software manuals are often hundreds of pages long filled with dense text that wastes your time trying to cover every corner and nuance of the software - ultimately leaving readers more confused than before they started. Phoenix Real World Scheduling assumes that the reader has no previous exposure to the software and takes the reader through the process of creating a schedule covering the same features that a contractor would include on their typical schedule. This includes creating and saving the schedule, covering numerous formatting options to customize the look of the schedule, working with calendars including 50% and 100% weather calendars, then activity coding the schedule to organize the activities. Different views of the schedule are explored and from there the schedule is updated covering all possible update scenarios

that may actually occur. The updated schedule is stored using Storepoints and then compared side-by-side to the original using Phoenix's very unique Comparisons feature. A custom Filter is then created to produce a Six Week Look-Ahead schedule. With this manual and a few hours of your time, you will be ready to effectively use Phoenix Project Manager on a real project.

Scheduling: Control-Based Theory and Polynomial-Time Algorithms K. Kogan, E. Khmel'nitsky, 2013-11-27
This book presents a first attempt to systematically collect, classify and solve various continuous-time scheduling problems. The classes of problems distinguish scheduling by the number of machines and products, production constraints and performance measures. Although such classes are usually considered to be a prerogative of only combinatorial scheduling literature, the scheduling methodology suggested in this book is based on two mathematical tools - optimal control and combinatorics. Generally considered as belonging to two totally different areas of research and application, these seemingly irreconcilable tools can be integrated in a unique solution approach with the advantages of both. This new approach provides the possibility of developing effective polynomial-time algorithms to solve the generic scheduling problems. This book

is aimed at a student audience - final year undergraduates as well as master and Ph.D. students, primarily in Operations Research, Management, Industrial Engineering and Control Systems. Indeed, some of the material in the book has formed part of the content of undergraduate and graduate courses taught at the Industrial Engineering Department of Tel-Aviv University, the Logistics Department of Bar-Ilan University and the Technology Management Department of Rolon Center for Technological Education, Israel. The book is also useful for practicing engineers interested in planning, scheduling and optimization methods. Since the book addresses the theory and design of computer-based scheduling algorithms, applied mathematicians and computer software specialists engaged in developing scheduling software for industrial engineering and management problems will find that the methods developed here can be embedded very efficiently in large applications.
