Combating Spyware in the Enterprise Paul Piccard,2006-08-04 Combating Spyware in the Enterprise is the first book published on defending enterprise networks from increasingly sophisticated and malicious spyware. Combating Spyware in the Enterprise begins by examining the various types of insidious spyware and adware currently propagating across the internet and infiltrating enterprise networks. This section closely examines Spyware's ongoing transformation from nuisance to malicious, sophisticated attack vector. Next, the book uncovers spyware's intricate economy and network of malicious hackers and criminals. Forensic investigations presented in this section of the book reveal how increasingly sophisticated spyware can compromise enterprise networks via trojans, keystroke loggers, system monitoring, distributed denial of service attacks, backdoors, viruses, and worms. After close examination of these attack vectors, the book begins to detail both manual and automated techniques for scanning your network for the presence of spyware, and customizing your IDS and IPS to detect spyware. From here, the book goes on to detail how to prevent spyware from being initially installed to mitigating the damage inflicted by spyware should your network become infected. Techniques discussed in this section include slowing the exposure rate; web filtering; using FireFox, MacOSX, or Linux; patching and updating, machine restrictions, shielding, deploying anti-spyware, and re-imaging. The book concludes with an analysis of the future of spyware and what the security community must accomplish to win the war against spyware. * A recent survey published by Information Security Magazine stated that combating spyware was the #2 priority for security professionals in 2005 * Despite the high priority placed on combating spyware by security professionals, there are no other books published or announced that address this market * Author Paul Piccard is Director of Research for Webroot, which is a market leader for pure-play anti-spyware vendors

Spyware Workshop: Monitoring Software On Your Personal Computer: Spyware, Adware, and Other Software: Report of the Federal Trade Commission Staff ,

Spyware John S. Yang,2005 The term 'spyware' is not well defined. Generally it is used to refer to any software that is downloaded onto a person's computer without their knowledge. Spyware may collect information about a computer user's activities and transmit that information to someone else. It may change computer settings, or cause 'pop-up' advertisements to appear (in that context, it is called 'adware'). Spyware may redirect a Web browser to a site different from what the user intended to visit, or change the user's home page. A type of spyware called 'keylogging' software records individual keystrokes, even if the author modifies or deletes what was written, or if the characters do not appear on the monitor. Thus, passwords, credit card numbers, and other personally identifiable information may be captured and relayed to unauthorized recipients. Some of these software programs have legitimate applications the computer user wants. They obtain the moniker 'spyware' when they are installed surreptitiously, or perform additional functions of which the user is unaware. Users typically do not realise that spyware is on their computer. They may have unknowingly downloaded it from the Internet by clicking within a website, or it might have been included in an attachment to an electronic mail message (e-mail) or embedded in other software. According to a survey and tests conducted by America Online and the National Cyber Security Alliance, 80% of computers in the test group were infected by spyware or adware, and 89% of the users of those computers were unaware of it. The Federal Trade Commission (FTC) issued a consumer alert on spyware in October 2004. It provided a list of warning signs that might indicate that a computer is infected with spyware, and advice on what to do if it is. This new book helps shed light on this insidious nightmare created by members of the human race to wreck havoc on the remainder.

For this purpose, several popular established firewall and anti virus software vendors are analyzed and tested.

That's a lot of people prying into what's on your PC, and a DSL or cable connection is a virtual welcome mat. Here's how you can * Learn to recognize when a Trojan horse, a virus, adware, or spyware has invaded your PC * Get the tools that can cure an infection * Dig into the Windows Registry to remove the nastiest of bugs * Prevent a recurrence with personal firewalls and protective software * Deal with the onslaught of spam * Keep your defenses up-to-date Give it the boot If you believe you've caught something and you're willing to kiss everything goodbye that you've added to or changed ... since the last time you booted up your computer ... try this. While Windows is first booting up, hit the F8 key Choose the Last Known Good Configuration option, and Windows should boot running the version of the Registry that existed the last time your system booted--that is, before you got infected. -- From Chapter 4
