Guide to the Universe: Outer Planets Glenn F. Chaple, 2009-09-10 A long-time avid amateur astronomer living in Massachusetts, Chaple profiles the Jovian planets, that is the gas giants and their many moons, but not the former planet Pluto. His topics include the birth of the Jovian planets, Jupiter's moons as a solar system in miniature, Saturn as the crown jewel of the Solar System (the full sized one), the tipped-over world Uranus, Neptune the planet discovered on paper, Jovian planets beyond our solar system, and Voyager 2's grand tour.

Planets William B. Rice, 2010-08-20 Earth is a planet, moving around the sun. But Earth is not the only planet in our solar system! It is one of eight planets, many moons, and other objects that orbit our sun. The planets have much in common, but they have many differences, too. In this Spanish-translated book, learn all about these exciting planets.

On the Origin of Planets Michael M Woolfson, 2010-09-23 The book begins with a historical review of four major theories for the origin of the Solar System in particular, or of planets in general, which highlight the major problems that need to be solved by any plausible theory. In many theories, including that which forms the major theme of this book, the formation of planets and stars is intimately linked, so four chapters are devoted to the processes that can be described as the birth, life and death of stars. Recent observations that have revealed the existence of planets around many Sun-like stars are described in detail, followed by a clear exposition of the Capture Theory for the origin of planets. Many aspects of this theory are illustrated with sophisticated computer modelling that convincingly demonstrates the plausibility of the theory. The Capture Theory is in complete accord with all observations, including the estimate it gives for the proportion of Sun-like stars with planets. It is the only theory that sits comfortably with all present observational and theoretical constraints. The general theory of planet formation does not explain the detailed structure of the Solar System. An early postulated collision of two major planets is shown to explain many disparate features of the Solar System — the nature of the terrestrial planets, surface features of the Moon and its relationship with Earth, asteroids, comets and dwarf planets, the relationship between Neptune, Triton and Pluto and the characteristics of meteorites, including the isotopic anomalies found in them. The postulate of a planetary collision is given

support by a 2009 NASA observation of the residue of such an event around a distant young star. Contents: Observations of Stars Producing Protostars — Embryonic Stars The Life and Death of a Star The Evolution of a Galactic Cluster Exoplanets — Planets Around Other Stars The Formation of Planets: The Capture Theory Orbital Evolution The Frequency of Planetary Systems Satellite Formation Features of the Solar System Interactions Between Planets The Moon Mars and Mercury Neptune, Triton and Pluto Dwarf Planets, Asteroids, Comets and the Kuiper Belt Meteorites: Their Physical and Chemical Properties Isotopic Anomalies in Meteorites Overview and Conclusions Readership: Undergraduates to researchers and also of general interest. Keywords: Planets: Solar System Key Features: There are no competing titles The structure of the book, with main chapters and appendices, should make it accessible and of interest to readers of different backgrounds The theory it deals with is described in fine detail — a model of presentation inspired by On The Origin of Species Reviews: “The first quarter of the presentation is a masterful summary of the history of the speculation about the origin of the sun and planets, a description of the properties of stars and star clusters, and an introduction to the exciting and developing field of exoplanets, objects that orbit distant stars ... The presentation is primarily qualitative, with the supporting physical principles usefully relegated to an extensive suite of appendixes ... the level is suitable for the advanced undergraduate.” CHOICE “This book describes the history and the problem of planetary formation question in more complete and attractive detail. In an unusual but excellent feature, the basic physics needed at each stage is broken out into a long series of appendixes, 39 in all.” Contemporary Physics

The Geology of the Terrestrial Planets Michael H. Carr, 1984

The Moon and the Planets, 1985

Meet the Planets John McGranaghan, 2011-02-10 Presents an introduction to the Solar System and the physical features of the eight planets that revolve around the Sun, in a text that includes learning activities.

The Planets Cynthia Pratt Nicolson, 1998 Did you know that Earth and Venus are almost the same size? Or that four of the nine planets in our solar system have rings? If you'd like to find out more about the planets, or try some experiments and read true science stories and legends, then *The Planets* is the book for you.

Solar System Planets and Exoplanets Joseph Bevelacqua, 2021-07-07 Solar System Planets and Exoplanets provides a current viewpoint of planetary systems. The solar system's planets and exoplanets are addressed in an overview manner, and specific space probe data are used to provide a current state of knowledge of Venus and Mars. Recent Mars data and associated observations are addressed in several chapters. Of particular interest are data that suggest the possibility that life could have existed on the planet's surface during its past when Mars' atmosphere was wetter and denser. The search for life on Mars is one of the main objectives of space missions, and it is an ongoing theme of this book. Key to the existence of life is the evolution of the radiation output of the Sun that is discussed and projected into the future. Space probe data related to the Asteroid Belt is also presented. Technological advances in terms of operating aircraft on Mars and propulsion systems provide useful commentary regarding future innovations that will enhance upcoming space missions and the search for life.

Newly Discovered Planets Corona Brezina, 2015-12-15 Researching exoplanets is a thrilling new frontier in science. There are periodically fresh stories in the media about exoplanets and the possibility of life existing outside Earth's solar system. Readers learn about scientists' speculations on faraway alien life. Profiles of fascinating exoplanets are examined, as are the technical matters of how scientists use spectra to obtain data about stars and planets. The habitable zone of a planet, what extreme life has been discovered, and what life-forms might exist on some moons are studied, as well as the Kepler Mission, launched in 2009 to search for Earth-like planets.

Exploring Pluto and Other Dwarf Planets Riley Lawrence, 2017-07-15 Pluto is too big to be an asteroid and too small to be a planet, so scientists call

it a dwarf planet. It's so far away from the sun that it gets no warmth at all, so it's covered in a thick layer of ice. Readers learn fun facts such as these as they explore the world of our solar system's dwarf planets. Informative diagrams, full-color photographs, and accessible text help readers discover more about Pluto and the other dwarf planets in our solar system.

The images are at once humbling and uplifting: Here in the black void of space is Saturn's frozen moon, Mimas, white

and pitted like a galactic golf ball; here is the tiny golden orb called Io, casting a shadow in a perfect inky circle on the marbled surface of Jupiter; here is the great sun, flames spurting from its surface like plumes.” —The Wall Street Journal “[A] gorgeous photographic tour of space . . .
