**Tagged** Diane C. Mullen,2015-03-10 Liam is a fourteen-year-old graffiti artist living in project housing in Minneapolis with his single mother and three younger siblings. When Liam's estranged older brother coerces him to tag a graffiti symbol for a rival gang, Liam's life is threatened. Due to his apathetic attitude in the classroom and on the baseball field, Liam's private-school scholarship is also threatened. His mother decides to send him to Lake Michigan for the summer to live with her best friend, Kat, a sculptor and art teacher, Liam soon delves into the work of Jean-Michel Basquiat, Pablo Picasso, and his own personal aesthetics. He's encouraged to consider his art seriously and how it might contribute to a greater community. Having to decide between staying with Kat and returning home to his siblings who need him, Liam's story inspires him to reinvent himself for the better.

**Cooperative Game Fish Tagging Program Annual Newsletter 1990** Edwin L. Scott, Robert E. Bayley, Joseph E. Tashiro, Curtis Watada, 1991 The Cooperative Game Fish Tagging Program is a joint research effort by scientists, recreational, and commercial fishermen. It is designed to provide basic information on the movements and biology of game fish populations in the Atlantic Ocean, Gulf of Mexico, and the Caribbean Sea through the direct participation of the public in scientific research. In 1990, program cooperators and scientists tagged and released 10,955 fish of 47 species in the Atlantic Ocean, Gulf of Mexico, and the Caribbean Sea. A total of 6,970 billfish were tagged and released: 3,309 sailfish, 1,274 white marlin, 1,993 blue marlin, and 394 swordfish. There were 1,256 tunas tagged and released: 597 yellowfin, 415 bluefin, and 244 miscellaneous tunas. Other species tagged and released by program cooperators were: 581 red drum, 772 tarpon, 456 king mackerel, 320 amberjack, and 201 cobia. In addition, 399 fish of 32 miscellaneous species were tagged and released--Page 1, paragraphs 1-2

**Electronic Tagging and Tracking in Marine Fisheries** John R. Sibert, Jennifer L. Nielsen, 2013-03-09 Reviews: Methods and Technology in Fish Biology and Fisheries published by Kluwer Academic Publishers is a book series dedicated to the publication of information on advanced, forward-looking methodologies, technologies, or perspectives in fish and is especially dedicated to relevant topics addressing global, fisheries. This series international concern in fish and fisheries. Humans continue to challenge our environments with new technologies and technological applications. The dynamic creativity of our own species often tends to place the greatest burden on our supporting ecosystems. This is especially true for aquatic networks of creeks, lakes, rivers and ocean environments. We also frequently use our conceptual powers to balance conflicting requirements and demands on nature and continue to develop new approaches and tools to provide sustainable resources as well as conserve what we hold most dear on local and global scales. This book series will provide a window into the developing dynamic among humans, aquatic ecosystems (both freshwater and marine), and the organisms that inhabit aquatic environments. There are many reasons to doubt the increasing social and economic value technology has gained over the last two centuries. Science and technology represent stages in human development. I agree with Ernst Mayer when he said in *Toward a New Philosophy of Biology* (1988) that endeavors to solve all scientific problems by pure logic and refined measurements are unproductive, if not totally irrelevant.

**Pink Salmon, Oncorhynchus Gorbuscha, Tagging Experiments in Southeastern Alaska, 1938-42 and 1945** Roy E. Nakatani, Gerald John Paulik, Richard Van Cleve, 1975 A total of 20, 532 pink salmon (*Oncorhynchus gorbuscha*) were tagged and released in southeastern Alaska north of Sumner Strait during the years of 1938 to 1942 inclusive, and in 1945. The recovery of 7, 027 of these tags in the fish traps confirmed the findings of other investigators that the pink salmon stocks of the northern part of southeast Alaska are separate from those in the southern part. They also show that pink salmon enter the northern part of southeast Alaska through two paths: (1) through Icy Strait, and (2) through the lower end of Chatham Strait. No evidence was found of movement through Peril Strait from Salisbury Sound into Chatham Strait. The centers of density of each group of tags appeared to move in a consistent manner, but a smaller number of tags from each release were dispersed throughout the northern part of southeastern Alaska. Differences were noted between the movements of fish in odd and even years. Also a larger proportion of earlier tagged fish moved to recovery locations farther [sic] inland. In all areas and in all years the fishing season closed about the time of the greatest abundance of fish in the fishery, therefore the later parts of the runs were not studied. Apparently the 1941 run was the largest and that in 1945 the smallest. Migration rates were studied by plotting the catch per trap as well as by the recovery of tags. The latter showed movements of 9.05 to 33.37 miles per day. Survival rates computed for thirty releases with total tag recovery periods of two or more weeks averaged 0.384. Weekly exploitation rates varied from 0.142 to 0.452 averaging 0.250. The weekly F exponential rate of fishing averaged 0.514. Recoveries of tags from seines were not used since their proportion of tags recovered was less than one-half their proportion of the catch. Recommendations are made for future tagging experiments based upon the results of this analysis.

Syntactic Wordclass Tagging H. van Halteren, 2013-03-14 In both the linguistic and the language engineering community, the creation and use of annotated text collections (or annotated corpora) is currently a hot topic. Annotated texts are of interest for research as well as for the development of natural language processing (NLP) applications. Unfortunately, the annotation of text material, especially more interesting linguistic annotation, is as yet a difficult task and can entail a substantial amount of human involvement. All over the world, work is being done to replace as much as possible of this human effort by computer processing. At the frontier of what can already be done (mostly) automatically we find syntactic wordclass tagging, the annotation of the individual words in a text with an indication of their morpho syntactic classification. This book describes the state of the art in syntactic wordclass tagging. As an attempt to give an overall view of the field, this book is of interest to (at least) two, possibly very different, types of reader. The first type consists of those people who are using, or are planning to use, tagged material and taggers. They will want to know what the possibilities and impossibilities of tagging are, but are not necessarily interested in the internal working of automatic taggers. This, on the other hand, is the main interest of our second type of reader, the builders of automatic taggers and other natural language processing software.

*Materials and Methods for Tagging Tuna and Billfishes, Recovering the Tags and Handling the Recapture Data* William H. Bayliff, Kim N. Holland, 1986 Conventional tags are applied to tunas and billfishes, using several different methods to handle the fish. The importance of making satisfactory arrangements for collecting the tagged fish which are recaptured, and the pertinent data, is discussed. Some suggestions for handling the data are given. Ultrasonic telemetry has been used extensively on tunas and billfishes during the last few years. Fishing techniques, transmitter attachment, hydrophone systems, and data collection and storage are discussed. Some tagging systems which may be used on tunas and billfishes in the future are described.

**Tagging and Tracking of Marine Animals with Electronic Devices** Jennifer L. Nielsen,Haritz Arrizabalaga,Nuno Fragoso,Alistair Hobday,Molly Lutcavage,John Sibert,2009-06-10 The 2nd international tagging and tracking symposium was held in San Sebastian, Spain, in October 2007, seven years after the first symposium was held in Hawaii in 2000 (Sibert and Nielsen 2001). In the intervening seven years, there have been major advances in both the capability and reliability of electronic tags and analytical approaches for geolocation of tagged animals in marine habitats. Advances such as increased data storage capacity, sensor development, and tag miniaturization have allowed researchers to track a much wider array of marine animals, not just large and charismatic species. Importantly, data returned by these tags are now being used in population analyses and movement simulations that can be directly utilized in stock assessments and other management applications. Papers in this volume are divided into three sections, the first describing insights into behavior achieved using acoustic, archival, and novel tags, the second reporting on advances in methods of geolocation, while the final section includes contributions where tag data have been used in management of marine species. Accurate documentation of animal movements and behaviors in critical marine habitats are impossible to obtain with other technologies. The management and conservation of marine species are critical in today’s changing ocean environment and as electronic tags become more accurate and functional for a diversity of organisms their application continues to grow, setting new standards in science and technology.
