**Fatigue of Metallic Materials** M. Klesnil, P. Lukác, 1992-04-13 This book reviews problems in the mechanical behaviour of cyclically loaded metallic materials, primarily with regard to the nature of the fatigue process. The first edition of the book appeared in 1980. The present second edition represents a revised form of the original book and also covers recent developments in the field. As the book focuses on physical-metallurgical aspects, it occupies a unique and important position in the technical literature, which has so far been devoted mainly to engineering metal fatigue problems and their technical solution in specific practical cases. The book provides a compact review of current knowledge on physical metallurgical processes that accompany and affect the fatigue of metallic materials, and also presents the background for applying the new results to practical designing and to the selection of materials in engineering practice. The authors present an updated review of results from countries both in the east and the west and cover a relatively large field in a concise manner. The work will be of value to research workers and students following advanced and post-graduate courses in the fields of materials

science and mechanical engineering.

**Bicycling Maximum Overload for Cyclists** Roy Wallack, Jacques Devore, Editors of Bicycling Magazine, 2017-06-13 Bicycling Maximum Overload for Cyclists is a radical strength-based training program aimed at increasing cycling speed, athletic longevity, and overall health in half the training time. Rather than improving endurance by riding longer distances, you'll learn how to do it by reducing your riding time and adding heavy strength and power training. Traditionally cyclists and endurance athletes have avoided strength and power training, believing that the extra muscle weight will slow them down, but authors Jacques DeVore and Roy M. Wallack show that exactly the opposite is true. The Maximum Overload program uses weightlifting to create sustainable power and improved speed while drastically reducing training time and eliminating the dreaded deterioration that often occurs during the second half of a ride. A 40-minute Maximum Overload workout, done once or twice a week, can replace a long day in the saddle and lead to even better results. This comprehensive program includes unique takes on diet, interval training,

hard and easy training, and sustainable power. Backed by the most trusted authority in the sport, Bicycling Maximum Overload for Cyclists is a book that no cyclist should be without.

**Mechanical Properties of Ceramics** Joshua Pelleg, 2014-04-22 This book discusses the mechanical properties of ceramics and aims to provide both a solid background for undergraduate students, as well as serving as a text to bring practicing engineers up to date with the latest developments in this topic so they can use and apply these to their actual engineering work. Generally, ceramics are made by moistening a mixture of clays, casting it into desired shapes and then firing it to a high temperature, a process known as 'vitrification'. The relatively late development of metallurgy was contingent on the availability of ceramics and the know-how to mold them into the appropriate forms. Because of the characteristics of ceramics, they offer great advantages over metals in specific applications in which hardness, wear resistance and chemical stability at high temperatures are essential. Clearly, modern ceramics manufacturing has come a long way from the early clay-processing fabrication method, and the last two decades have seen the development of sophisticated techniques to produce a large variety of ceramic material. The chapters of this volume are ordered to help students with their laboratory experiments and guide their observations in parallel with lectures based on the current text. Thus, the first chapter is devoted to mechanical testing. A chapter of ductile and superplastic ceramic is added to

emphasize their role in modern ceramics (chapter 2). These are followed by the theoretical basis of the subject. Various aspects of the mechanical properties are discussed in the following chapters, among them, strengthening mechanisms, time dependent and cyclic deformation of ceramics. Many practical illustrations are provided representing various observations encountered in actual ceramic-structures of particularly technical significance. A comprehensive list of references at the end of each chapter is included in this textbook to provide a broad basis for further studying the subject. The work also contains a unique chapter on a topic not discussed in other textbooks on ceramics concerning nanosized ceramics. This work will also be useful as a reference for materials scientists, not only to those who specialize in ceramics.

**Run Like a Pro (Even If You're Slow)** Matt Fitzgerald, Ben Rosario, 2022-03-01 Cutting-edge advice on how to achieve your personal best, for everyone from casual runners to ultramarathoners. In 80/20 Running, respected running and fitness expert Matt Fitzgerald introduced his revolutionary training program and explained why doing 80 percent of runs at a lower intensity and just 20 percent at a higher intensity is the best way for runners at all levels--as well as cyclists, triathletes, and even weight-loss seekers--to improve their performance. Now, in this eye-opening follow-up, Fitzgerald teams with Olympic coach Ben Rosario to expand and update the

80/20 program to include ultramarathon training and such popular developments as the use of power meters. New research has bolstered the case that the 80/20 method is in fact that most effective way to train for distance running and other endurance sports. Run Like a Pro (Even If You're Slow) shows readers how to take the best practices in elite running and adopt them within the limits of their own ability, lifestyle, and budget.

**Easy Cross Stitch for Starters** Dr Raphael Taylor, 2021-06-24 Cross stitch is one of the most popular forms of embroidery - so popular that every craft store sells materials devoted to this. The gist of cross stitching is that you will do X-shaped stitches within a certain equal width of a number of warp and weft fabric threads to form a bitmap. Cross stitch is used to decorate items like liners, placemats, coasters, pillows, among others. It is also used to embellish clothing like those of the traditional costumes of Central and Eastern Europe. Cross stitch works that resemble paintings (which are framed and hung on the wall) were a later development to this art form. Cross stitch can also be incorporated with other forms of embroidery like the typical crewel embroidery and also needlepoint.
