*NOVEL DRUG DELIVERY SYSTEM* Dr. N.G. Raghavendra Rao, Dr. L. MATSYAGIRI, Dr. Chatlapelli Kishore, Mr. BARIKI RAJASEKHAR, The fascinating world of Novel Drug Delivery Systems is yours to explore. In this book, we set out on a thrilling voyage through the constantly changing field of drug distribution, where groundbreaking discoveries and fresh ideas are revolutionizing how we use and perceive medication. It is our honor to expose to the enormous world of innovative drug delivery systems and explore their principles, uses, and promise to transform healthcare as the author of this comprehensive resource. This book's rigorous planning ensures a thorough comprehension of the subject matter by covering a broad variety of subjects that line up with the drug delivery systems curriculum. We go into the fundamentals of controlled medication delivery systems in Unit-I. We discuss controlled release formulation language, meanings, and justifications. We investigate the design concepts of diffusion, dissolution, and ion exchange for creating controlled release formulations. We also look at drug formulation-relevant physicochemical and biological characteristics. Polymers and the creation of formulations and we categorize polymers according to their characteristics and talk about their benefits for controlled release medication delivery systems. Methods for microencapsulation are introduced in Unit II. We explore implantable drug delivery devices and acquire understanding of mucosal drug delivery systems, including bioadhesion and mucoadhesion concepts. Transdermal drug delivery methods are examined in Unit-III, with an emphasis on skin penetration and the variables that affect it. We look into transdermal medication delivery system components and permeability enhancers. We also explore techniques for delivering gastroretentive drugs, such as floating and high-density systems, inflatable systems, and gastro sticky systems. We address nasal and pulmonary routes, formulation strategies, and delivery devices as we examine the Nasopulmonary drug delivery system. Targeted drug delivery is the subject of Unit-IV, which examines theories, methods, and the potential of liposomes, niosomes, nanoparticles, and monoclonal antibodies.

Topology Optimization in Structural and Continuum Mechanics George I. N. Rozvany,Tomasz Lewinski,2013-09-20 The book covers new developments in structural topology optimization. Basic features and limitations of Michell's truss theory, its extension to a broader class of support conditions, generalizations of truss topology optimization, and Michell continua are reviewed. For elastic bodies, the layout problems in linear elasticity are discussed and the method of relaxation by homogenization is outlined. The classical problem of free material design is shown to be reducible to a locking material problem, even in the multiload case. For structures subjected to dynamic loads, it is explained how they can be designed so that the structural eigenfrequencies of vibration are as far away as possible from a prescribed external excitation frequency (or a band of excitation frequencies) in order to avoid resonance phenomena with high vibration and noise levels. For diffusive and convective transport processes and multiphysics problems, applications of the density method are discussed. In order to take uncertainty in material parameters, geometry, and operating conditions into account, techniques of reliability-based design optimization are introduced and reviewed for their applicability to topology optimization.
