Protecting Our Ports Suzette R. Grillo, Rebecca J. Cruise, 2016-04-08 Since the terrorist attacks of September 11, 2001, there has been much discussion of the security of borders and ports of entry in the United States and around the world. Ports of entry, particularly sea ports, are viewed as one of the most defenceless targets for a terrorist attack. In response to this perceived vulnerability, a number of port security initiatives have been implemented both on both a domestic and international level. This timely project investigates a number of issues surrounding the container security issue. It examines the scope of containerized freight security, analyzes cooperation between agents in the United States and abroad, explores the politics of port security, and provides an assessment of 17 of the world's sea ports. The work sheds light on the container security threat and the domestic and international responses that have emerged, as well as those steps that still must be taken.

Linux Firewalls Michael Rash, 2007-09-07 System administrators need to stay ahead of new security vulnerabilities that leave their networks exposed every day. A firewall and an intrusion detection system (IDS) are two important weapons in that fight, enabling you to proactively deny access and monitor network traffic for signs of an attack. **Linux Firewalls** discusses the technical details of the iptables firewall and the Netfilter framework that are built into the Linux kernel, and it explains how they provide strong filtering, Network Address Translation (NAT), state tracking, and application layer inspection capabilities that rival many commercial tools. You'll learn how to deploy iptables as an IDS with psad and fwsnort and how to build a strong, passive authentication layer around iptables with fwknop. Concrete examples illustrate concepts such as firewall log analysis and policies, passive network authentication and authorization, exploit packet traces, Snort ruleset emulation, and more with coverage of these topics: –Passive network authentication and OS fingerprinting –iptables log analysis and policies –Application layer attack detection with the iptables string match extension –Building an iptables ruleset that emulates a Snort ruleset –Port knocking vs. Single Packet Authorization (SPA) –Tools for visualizing iptables logs Perl and C code snippets offer practical examples that will help you to maximize your deployment of Linux firewalls. If you're responsible for keeping a network secure, you'll find **Linux Firewalls** invaluable in your attempt to understand attacks and use iptables—along with psad and fwsnort—to detect and even prevent compromises.
