Special Edition Using Corel WordPerfect 10 Laura Acklen,Read Gilgen,2002 For those who want to master the intermediate and advanced features of WordPerfect in the shortest possible time, this book includes nearly 500 expert tips, approximately 20 start-to-finish projects and troubleshooting guidance.

Readings in Database Systems Joseph M. Hellerstein,Michael Stonebraker,2005 The latest edition of a popular text and reference on database research, with substantial new material and revision; covers classical literature and recent hot topics. Lessons from database research have been applied in academic fields ranging from bioinformatics to next-generation Internet architecture and in industrial uses including Web-based e-commerce and search engines. The core ideas in the field have become increasingly influential. This text provides both students and professionals with a grounding in database research and a technical context for understanding recent innovations in the field. The readings included treat the most important issues in the database area--the basic material for any DBMS professional. This fourth edition has been substantially updated and revised, with 21 of the 48 papers new to the edition, four of them published for the first time. Many of the sections have been newly organized, and each section includes a new or substantially revised introduction that discusses the context, motivation, and controversies in a particular area, placing it in the broader perspective of database research. Two introductory articles, never before published, provide an organized, current introduction to basic knowledge of the field; one discusses the history of data models and query languages and the other offers an architectural overview of a database system. The remaining articles range from the classical literature on database research to treatments of current hot topics, including a paper on search engine architecture and a paper on application servers, both written expressly for this edition. The result is a collection of papers that are seminal and also accessible to a reader who has a basic familiarity with database systems.

Create your own 3D Video Games like pros with Blender Gregory Gossellin de Benicourt,2023-02-22 Reserved, for a long time, to a small circle of enthusiast developers, 3D is not yet commonly used by independent video games development studios (the Indies). It's for a good reason: the entrance ticket is relatively high. With Blender 2.76 (free and Open Source), you can model, animate, create a 3D rendering and have a game engine. It is a perfect tool for the beginner and for the one that wants to create a commercial game. Blender is also a complement to tools like Unity, CryEngine, Unreal Engine and other commercial engines. Thanks to the resources freely available to everybody on the Internet, you don't have to be graphic designer or programmer to create a game. You don't want to read 400 pages of theory about modeling, animating and programming in python? This book was written for you. You are invited to create directly several game projects: a platform game (like Super mario), a First-person Shooter (like Doom, Far Cry or Half-Life), a Third-person RPG (like Tomb Raider, GTA or Watch Dogs), a voxel sandbox game (like Minecraft), a car race and a flight simulator. With these projects, about a hundred recipes will help you to create any type of game. If you aren't an addict, it'll come to you sooner than you realize. It's more fun to create a game than to play with the last blockbuster. You'll be the architect of a new world, with its own rules. The only limits are the one of your imagination... High technology enthusiast, games addict and 3D geek, the author wants to honor these games that have revolutionized this domain.

An Approach to Cost Effectiveness of a Selective Mechanized Document Processing System Carlos O. Segarra,1967 The purpose of the project was to identify and define the parameters of an economical and practical information system for the U.S. Army Engineer Research and Development Laboratories. The program included four phases: data requirements definition; cost analysis and system definition; hardware selection, system test and evaluation; and development of software. The method of approach for each phase is given, and the procedures used and decision criteria developed are discussed. Results of decision to mechanize operations in the information center lead to the selection and installation of four machines, all components of the IBM 870 Document Writing System, within a rental budget of \$7,000 per year. Results of mechanizing, after operation for one year, included: reduced processing costs by rejecting reports having no relevancy to on-going tasks; eliminated the need for overtime required under manual conditions;

reduced actual processing costs of documents; reduced processing time per report from 75 days to 5 days; and relieved staff of routine clerical workloads, thereby extending their capacity to optimize other information functions. (Author).

Algorithms for Memory Hierarchies Ulrich Meyer,Peter Sanders,2003-04-07 Algorithms that have to process large data sets have to take into account that the cost of memory access depends on where the data is stored. Traditional algorithm design is based on the von Neumann model where accesses to memory have uniform cost. Actual machines increasingly deviate from this model: while waiting for memory access, nowadays, microprocessors can in principle execute 1000 additions of registers; for hard disk access this factor can reach six orders of magnitude. The 16 coherent chapters in this monograph-like tutorial book introduce and survey algorithmic techniques used to achieve high performance on memory hierarchies; emphasis is placed on methods interesting from a theoretical as well as important from a practical point of view.

Alpha (1) E. Bruce Brooks,Alvin P. Cohen,Glenn S. Holland,2017-12-31 Alpha is an annual repository for leading-edge research in the New Testament and related texts, and the historical development which the texts imply. Like its older sister journal Warring States Papers, it has a central focus on the methodology of text-based historical research, and includes examples of the application of basic historical and philological methods to texts in other traditions, including Chinese and Homeric Greek. In the past, the early Christian texts have been approached theologically, rather than as historical sources. Christian history has been seen as fully realized in Paul, and all other viewpoints are dismissed as later heresies. But many of the NT texts give hints of a pre-Pauline Christianity, the thing Paul began by persecuting. The work of the Project leads to an unexpectedly full picture of that pattern of early belief and practice. It is this to which we have given the name Alpha Christianity. It turns out to be remarkably close to what many contemporary Christians actually live. This first volume takes up the principal Gospels and other early sources for the teachings of Jesus. It notes evidence for stratification in Mark, leading to the earliest and thus most authoritative stratum of that text. It finds no need to posit a common source for Matthew and Luke, and instead argues for mutual contact between them. Mandaean and Gospel echoes of John the Baptist are compared, the work of William O Walker Jr on interpolations in Paul is continued, and a foundation is laid for the introduction of a new stylistic difference test in v2.
