The Vixen Star Book User Guide James Chen, Adam Chen, 2015-10-01 This book is for anyone who owns, or is thinking of owning, a Vixen Star Book Ten telescope mount or its predecessor. A revolution in amateur astronomy has occurred in the past decade with the wide availability of high tech, computer-driven, Go-To telescopes. Vixen Optics is leading the way by offering the Star Book Ten system, with its unique star map graphics software. The Star Book Ten is the latest version of computer telescope control using star map graphics as a user interface, first introduced in the original Star Book first offered in 2003. The increasingly complicated nature of this software means that learning to optimize this program is not straightforward, and yet the resulting views when all features are correctly deployed can be phenomenal. After a short history of computerized Go-To telescopes for the consumer amateur astronomer market, Chen offers a treasury of technical information. His advice, tips, and solutions aid the user in getting the most out of the Star Book Ten system in observing sessions.

Astronomy on the Personal Computer Oliver Montenbruck, Thomas Pfleger, 2013-06-29 This long-awaited new edition of Montenbruck and Pfleger's successful book now includes chapters on perturbation calculations and on the calculation of physical ephemerides of the major planets and the sun. The book provides the reader with numerous programs and instructions for time and date calculation and for treating the two-body problem. Each chapter is carefully structured according to topic and closes with the listing of a relevant program, thereby facilitating its use as a practical handbook. The necessary astronomical and numerical fundamentals are also included in the text. The accompanying diskette has equally been completely revised.

Low Frequency Radio Astronomy and the LOFAR Observatory George Heald, John McKean, Roberto Pizzo, 2018-09-04 This book presents lecture materials from the Third LOFAR Data School, transformed into a coherent and complete reference book describing the LOFAR design, along with descriptions of primary science cases, data processing techniques, and recipes for data handling. Together with hands-on exercises the chapters, based on the lecture notes, teach fundamentals and practical knowledge. LOFAR is a new and innovative radio telescope operating at low radio frequencies (10-250 MHz) and is the first of a new generation of radio interferometers that are leading the way to the ambitious Square Kilometre Array (SKA) to be built in the next decade. This unique reference guide serves as a primary information source for research groups around the world that seek to make the most of LOFAR data, as well as those who will push these topics forward to the next level with the design, construction, and realization of the SKA. This book will also be useful as supplementary reading material for any astrophysics overview or astrophysical techniques course, particularly those geared towards radio astronomy (and radio astronomy techniques).

Dictionary of Astronomy and Astronautics Armand Spitz, Frank Gaynor, 1959-01-15 Concise definitions of over 2,200 terms and concepts related to astronomy and astronautics—a wide gamut of terms ranging from those as old as man to those as new as the Space Age on the threshold of which he now stands.

Astronomical Numbers Thomas Wm. Hamilton, 2016-06-23 Thomas Wm. Hamilton's latest book, *Astronomical Numbers*, provides most of the commonly referenced and used numbers in astronomy. This includes the diameters of the sun, all the planets, and major moons, distances of orbits, magnitude scales,

frequency of eclipses, the five different kinds of lunar month, and more. To maximize usefulness, all values are in both English units (e.g. miles) and metric (e.g. kilometers), and provide conversions for units commonly used in astronomy, such as the astronomical unit, lightyear, and parsec. Says the author, "There is a real need for a convenient and quick reference for all this astronomical data, which is scattered and time-consuming to find."

Advances in Machine Learning and Data Mining for Astronomy Michael J. Way, Jeffrey D. Scargle, Kamal M. Ali, Ashok N. Srivastava, 2012-03-29 *Advances in Machine Learning and Data Mining for Astronomy* documents numerous successful collaborations among computer scientists, statisticians, and astronomers who illustrate the application of state-of-the-art machine learning and data mining techniques in astronomy. Due to the massive amount and complexity of data in most scientific disciplines

Lecture Notes for Introduction to Astronomy Ka Chun Yu, 2014-08-08 This course will take place in the planetarium during the next six weeks. For the first lecture, we will go over the night sky as seen from the Earth, and talk about the patterns in the sky that are visible, how they change over time, and how they change their appearance when we move around on the Earth. The two weeks following, we will move out into the Solar System and start exploring our neighboring planets. First we will cover the four inner terrestrial planets: the Earth, Mars, Venus, and Mercury. We will talk about specifics of their surfaces and atmospheres and compare their different geologies and activity. The next week, we will move into the outer solar system where we will focus on the four gas giant planets, their icy moons, and the host of other rocky and icy bodies and debris in the outer Solar System. This latter category includes comets in the Oort Cloud as well as the Kuiper Belt objects.
