Software Development on a Leash David Birmingham, Valerie Haynes Perry,2002-03-25 Software Development on a Leash is designed as a roadmap for experienced developers and architects who are interested in implementing a turbocharged software development process that encourages reuse and innovation. Author David Birmingham's products have been successfully deployed in a variety of venues, including highly complex desktop environments, with rapid turnaround and high-intensity delivery deadlines. This book contrasts the application-centric development approach to the architecture-centric development approach, introducing the concept of the metamorphic superpattern—the capability of a software program to dynamically adapt to changing application requirements without rebuilding the binary executable. Birmingham invites the reader to deploy reusable structural and behavioral building blocks, along with some powerful frameworks to gain immediate traction in any setting. He includes a high-speed multidimensional toolkit to organize and deploy the building blocks, essentially weaving the application together at run-time rather than being hard-wired in program code. Birmingham then ties the building blocks together with structural and behavioral metadata, allowing simple, interpreted macros to drive everything from database access, screen layouts, and many aspects of software development normally embedded directly into the software program and reused! The rapid deployment effect this creates allows developers to perform simple surgical application changes or rapid, sweeping rework/enhancement—without changing compiled software.

Hardware and Software: Verification and Testing Hana Chockler, Alan J. Hu, 2009-04-20 These are the conference proceedings of the 4th Haifa Verification Conference, held October 27–30, 2008 in Haifa, Israel. This international conference is a unique venue that brings together leading researchers and practitioners of both formal and dynamic verification, for both hardware and software systems. This year's conference extended the successes of the previous years, with a large jump in the number of submitted papers. We received 49 total submissions, with many more high-quality papers than we had room to accept. Submissions came from 19 different countries, reflecting the growing international visibility of the conference. Of the 49 submissions, 43 were regular papers, 2 of which were later withdrawn, and 6 were tool papers. After a rigorous review process, in which each paper received at least four independent reviews from the distinguished Program Committee, we accepted 12 regular papers and 4 tool papers for presentation at the conference and inclusion in this volume. These numbers give acceptance rates of 29% for regular papers and 67% for tool papers (34% combined) – comparable to the elite, much older, conferences in the field. A Best Paper Award, selected on the basis of the reviews and scores from the Program Committee, was presented to Edmund Clarke, Alexandre Donzé, and Axel Legay for their paper entitled "Statistical Model Checking of Mixed-Analog Circuits with an Application to a Third-Order Delta-Sigma Modulator." The refereed program was complemented by an outstanding program of invited talks, panels, and special sessions from prominent leaders in the field.

New Software Engineering Paradigm Based on Complexity Science Jay Xiong, 2011-02-14 This book describes a complete revolution in software engineering based on complexity science through the establishment of NSE – Nonlinear Software Engineering paradigm which complies with the essential principles of complexity science, including the Nonlinearity principle, the Holism principle, the Complexity Arises From Simple Rules principle, the Initial Condition Sensitivity principle, the Sensitivity to Change principle, the Dynamics principle, the Openness principle, the Self-organization principle, and the Self-adaptation principle. The aims of this book are to offer revolutionary solutions to solve the critical problems existing with the old-established software engineering paradigm based on linear thinking and simplistic science complied with the superposition principle, and make it possible to help software development organizations double their productivity, halve their cost, and remove 99% to 99.99% of the defects in their software products, and efficiently handle software complexity, conformity, visibility, and changeability. It covers almost all areas in software engineering. The tools NSE_CLICK- an automatic acceptance testing platform for outsourcing (or internally developed) C/C++ products, and NSE_CLICK_J - an automatic acceptance testing platform for outsourcing (or internally developed) Java products are particularly designed for non-technical readers to view/review how the acceptance testing of a software product developed with NSE can be performed automatically, and how the product developed with NSE is truly maintainable at the customer site.

Conversations with Catalogers in the 21st Century Elaine R. Sanchez, 2010-12-16 Authored by cataloging librarians, educators, and information system experts, this book of essays addresses ideas and methods for tackling the modern challenges of cataloging and metadata practices. Library specialists in the cataloging and metadata professions have a greater purpose than simply managing information and connecting users to resources. There is a deeper and more profound impact that comes of their work: preservation of the human record. Conversations with Catalogers in the 21st Century contains four chapters addressing broad categories of issues that catalogers and metadata librarians are currently facing. Every important topic is covered, such as changing metadata practices, standards, data record structures, data platforms, and user expectations, providing both theoretical and practical information. Guidelines for dealing with present challenges are based on fundamentals from the past. Recommendations on training staff, building new information platforms of digital library resources, documenting new cataloging and metadata competencies, and establishing new workflows enable a real-world game plan for improvement.

Software Engineering Andrea De Lucia,Filomena Ferrucci,2013-01-03 Software engineering is widely recognized as one of the most exciting, stimulating, and profitable research areas, with a significant practical impact on the software industry. Thus, training future generations of software engineering researchers and bridging the gap between academia and industry are vital to the field. The International Summer School on Software Engineering (ISSSE), which started in 2003, aims to contribute both to training future researchers and to facilitating the exchange of knowledge between academia and industry. This volume consists of chapters originating from a number of tutorial lectures given in 2009, 2010, and 2011 at the International Summer School on Software Engineering, ISSSE, held in Salerno, Italy. The volume has been organized into three parts, focusing on software measurement and empirical software engineering, software analysis, and software management. Extracting Spatial Information from Historical Maps Benedikt Budig,2018-11-23 Historical maps are fascinating documents and a valuable source of information for scientists of various disciplines. Many of these maps are available as scanned bitmap images, but in order to make them searchable in useful ways, a structured representation of the contained information is desirable. This book deals with the extraction of spatial

information from historical maps. This cannot be expected to be solved fully automatically (since it involves difficult semantics), but is also too tedious to be done manually at scale. The methodology used in this book combines the strengths of both computers and humans: it describes efficient algorithms to largely automate information extraction tasks and pairs these algorithms with smart user interactions to handle what is not understood by the algorithm. The effectiveness of this approach is shown for various kinds of spatial documents from the 16th to the early 20th century.

Emerging Technologies for the Evolution and Maintenance of Software Models
 Rech, Jörg, 2011-12-31 Model-driven software development drastically alters the software development process, which is characterized by a high degree of innovation and productivity. Emerging Technologies for the Evolution and Maintenance of Software Models contains original academic work about current research and research projects related to all aspects affecting the maintenance, evolution, and reengineering (MER), as well as long-term management, of software models. The mission of this book is to present a comprehensive and central overview of new and emerging trends in software model research and to provide concrete results from ongoing developments in the field.
