Particle Accelerator Design: Computer Programs John Colonias,2012-12-02 Particle Accelerator Design: Computer Programs describes some of the most important computer programs applicable to the design of particle accelerators. Computer programs that calculate magnetic and electric fields are considered, along with programs that calculate orbits of particles in a magnetic and/or electric field. Some representative programs useful in the design of linear accelerator-type cavities are also discussed. This book is comprised of six chapters and begins with a review of two-dimensional magnetostatic programs, including TRIM, LINDA, NUTCRACKER, MAREC, GRACY, and COILS. The University of Colorado's magnet program is also examined. The next chapter is devoted to programs capable of solving problems relating to the calculation of electrostatic fields in two-dimensional geometries. The reader is also introduced to programs that perform calculations of three-dimensional linear and nonlinear problems, along with programs that employ matrix formalism and integration of equations of motion. The final chapter looks at programs for linear accelerator-type cavities, including CURE, JESSY, MESSYMESH, and AZTEC. This monograph will be a useful resource for physical scientists, engineers, and computer programmers.

Designing the Successful Corporate Accelerator Jules Miller,Jeremy Kagan,2021-03-16 Accelerators can be powerful tools to build and transform businesses in a short period of time, which is why they have spread like wildfire in the corporate world. Designing the Successful Corporate Accelerator gives readers the tools to design, create, and manage successful corporate accelerators that achieve results time and time again. Authors Jules Miller and Jeremy Kagan are seasoned professionals in this space, and combine global market research, interviews with accelerator leaders, and their own experience launching and running accelerators to share what works—and what doesn't. The first half of the book takes a broader look at corporate innovation as a whole and how accelerators fit in, then the second half offers practical advice for how to launch, run, and manage world-class accelerator programs. Perfect for executives, employees, founders, investors, intrapreneurs, and entrepreneurs, Designing the Successful Corporate Accelerator is a practical guidebook for anyone with a passion for corporate innovation and entrepreneurship.

Reviews of Accelerator Science and Technology Alexander W Chao,Weiren Chou,2015-02-11 The idea of colliding two particle beams to fully exploit the energy of accelerated particles was first proposed by Rolf Wideröe, who in 1943 applied for a patent on the collider concept and was awarded the patent in 1953. The first three colliders — AdA in Italy, CBX in the US, and VEP-1 in the then Soviet Union — came to operation about 50 years ago in the mid-1960s. A number of other colliders followed. Over the past decades, colliders defined the energy frontier in particle physics. Different types of colliders — proton-proton, proton-antiproton, electron-positron, electron-proton, electron-ion and ion-ion colliders — have played complementary roles in fully mapping out the constituents and forces in the Standard Model (SM). We are now at a point where all predicted SM constituents of matter and forces have been found, and all the latest ones were found at colliders. Colliders also play a critical role in advancing beam physics, accelerator research and technology development. It is timely that RAST Volume 7 is dedicated to Colliders. Exciting Physics With New Accelerator Facilities - Proceedings Of The International Workshop Hiroshi Toki,Shin Date,1998-10-07 This volume discusses the exciting physics with new accelerator facilities, which are being constructed or proposed in various places. The facilities are RHIC (Brookhaven), CEBAF (TJINP), SPring-8 (Nishi-Harima), RIBF (RIKEN), JHP (KEK-INS), RIB (MSU), LISS (IUCF) and COSY (Juelich). RHIC aims at the creation of a QCD deconfinement phase and the study of the properties of such matter. CEBAF and SPring-8 use leptons to probe the quark-gluon structures of hadrons and nuclei. LISS and COSY use high resolution hadron beams to study hadron structures. JHP produces strong secondary hadron beams for hyper-nuclear physics and rare decay studies of basic symmetries. RIBF and RIB produce radioactive nuclear beams for the study of the nuclear structure of unstable nuclei far from beta stability, and astrophysics issues.
