As in the past, the symposium brought together leading researchers and practitioners from academia, government, and industry to discuss intrusion detection research and practice. There were six main sessions presenting full research papers on anomaly and specification-based approaches, malware detection and prevention, network and host intrusion detection and prevention, intrusion detection for mobile devices, and high-performance intrusion detection. Furthermore, there was a poster session on emerging research areas and case studies. The RAID 2009 Program Committee received 59 full paper submissions from all over the world. All submissions were

carefully reviewed by independent - viewers on the basis of space, topic, technical assessment, and overall balance. The final selection took place at the Program Committee meeting on May 21 in Oakland, California. In all, 17 papers were selected for presentation and publication in the conference proceedings. As a continued feature, the symposium accepted submissions for poster presentations which have been published as extended abstracts, reporting early-stage research, demonstration of applications, or case studies. Thirty posters were submitted for a numerical review by an independent, three-person sub-committee of the Program Committee based on novelty, description, and evaluation. The sub-committee recommended the acceptance of 16 of these posters for presentation and publication. The success of RAID 2009 depended on the joint effort of many people.

Will they unravel the malevolent plot and thwart utter catastrophe, or will the world change forever?

A Pathology of Computer Viruses David Ferbrache, 2012-12-06 The 1980's saw the advent of widespread (and potentially damaging) computer virus infection of both personal computer and mainframe systems. The computer security field has been comparatively slow to react to this emerging situation. It is only over the last two years that a significant body of knowledge on the operation, likely evolution and prevention of computer viruses has developed. *A Pathology of Computer Viruses* gives a detailed overview of the history of the computer virus and an in-depth technical review of the principles of computer virus and worm operation under DOS, Mac, UNIX and DEC operating systems. David Ferbrache considers the possible extension of the threat to the mainframe systems environment and suggests how the threat can be effectively combatted using an antiviral management plan. The author addresses the latest developments in stealth virus operations, specifically the trend for virus authors to adopt extensive camouflage and concealment techniques, which allow viruses to evade both existing anti-viral software and to avoid detection by direct observation of machine behaviour. *A Pathology of Computer Viruses* addresses a distinct need - that of the computer specialist and professional who needs a source reference work detailing all aspects of the computer virus threat.
