Nonisotopic Probing, Blotting, and Sequencing Larry J. Kricka,1995-06-01 Since the publication of Nonisotopic DNA Probe Techniques in 1992, the move away from radioactive materials for research and diagnostics has continued. This is due in part to public awareness of the hazards of radioactive waste and laws making radioactive disposal more difficult and costly and to improvement in both the sensitivity and convenience of nonisotopic techniques. Several new nonisotopic techniques have been developed and substantial improvements made to existing nonisotopic methods since 1992, and these are now included in Nonisotopic Probing, Blotting, and Sequencing. Nonisotopic Probing, Blotting, and Sequencing is an updated, expanded edition of the bestseller, Nonisotopic DNA Probe Techniques. It has been thoroughly revised to include the latest improvements in nonisotopic tagging techniques for macromolecules. Like its predecessor, it enables researchers to select the best nonisotopic method for their needs and maximize success by following its straightforward protocols. Provides strategies and detailed procedures for labeling, blotting, and probing specific nucleic acid sequences and, with this edition, protein molecules Gives protocols for nonisotopic DNA sequencing - new in this edition Gives extensive, practical information Presents background information for each method Provides expert accounts from the inventor or developer of each method Contains seven entirely new chapters Covers all major types of nonisotopic procedures for labeling and detection

OFDM and MC-CDMA for Broadband Multi-User Communications, WLANs and Broadcasting Lajos Hanzo,M. Münster,Byungcho Choi,Thomas Keller,2005-01-28 Orthogonal frequency-division multiplexing (OFDM) is a method of digital modulation in which a signal is split into several narrowband channels at different frequencies. CDMA is a form of multiplexing, which allows numerous signals to occupy a single transmission channel, optimising the use of available bandwidth. Multiplexing is sending multiple signals or streams of information on a carrier at the same time in the form of a single, complex signal and then recovering the separate signals at the receiving end. Multi-Carrier (MC) CDMA is a combined technique of Direct Sequence (DS) CDMA (Code Division Multiple Access) and OFDM techniques. It applies spreading sequences in the frequency domain. Wireless communications has witnessed a tremendous growth during the past decade and further spectacular enabling technology advances are expected in an effort to render ubiquitous wireless connectivity a reality. This technical in-depth book is unique in its detailed exposure of OFDM, MIMO-OFDM and MC-CDMA. A further attraction of the joint treatment of these topics is that it allows the reader to view their design trade-offs in a comparative context. Divided into three main parts: Part I provides a detailed exposure of OFDM designed for employment in various applications Part II is another design alternative applicable in the context of OFDM systems where the channel quality fluctuations observed are averaged out with the aid of frequency-domain spreading codes, which leads to the concept of MC-CDMA Part III discusses how to employ multiple antennas at the base station for the sake of supporting multiple users in the uplink Portrays the entire body of knowledge currently available on OFDM Provides the first complete treatment of OFDM, MIMO(Multiple Input Multiple Output)-OFDM and MC-CDMA Considers the benefits of channel coding and space time coding in the context of various application examples and features numerous complete system design examples Converts the lessons of Shannon's information theory into design principles applicable to practical wireless systems Combines the benefits of a textbook with a research monograph where the depth of discussions progressively increase throughout the book This all-encompassing self-contained treatment will appeal to researchers, postgraduate students and academics, practising research and development engineers working for wireless communications and computer networking companies and senior undergraduate students and technical managers.

Be Better Than Your BS Risha Grant,2023-08-15 WALL STREET JOURNAL, PUBLISHERS WEEKLY & USA TODAY BESTSELLER! A book on DEI in the workplace that speaks not only to executives but to employees at all levels of a company, by award-winning diversity consultant Risha Grant. DEI consultant and corporate speaker, Risha Grant, shares her practice of learning how to welcome and embrace people's full humanity, without BS, full stop. What's BS? It's bullshit for sure, but more specifically it's the powerful and often invisible belief systems we've been steeped in since birth—the judgment and bias we carry with us that impact our own lives and the many others we encounter every day. Risha teaches us about the inner work and the outer work we need to do to dismantle our “biasphere,” and change how we see ourselves and how we interact with others. The more people are willing to acknowledge and address the biases inherent in their belief systems, the more those biases will dissipate and the better our work environments will become. Readers will learn how to: Recognize when your BS manifests as “isms” and phobias that follow you to work Cure scarcity mentality, a damaging byproduct of fear Validate other people's experiences Become a real ally Engage in micro efforts that can effect change on a macro level Create an environment that fosters a sense of belonging for everybody; that is, “get in where you fit in” Abolish groupthink and create space for diverse ideas Design explicit feedback channels Generate truly inclusive policies that people can trust Spot and stop bullying (it doesn't always look the way you think it does) Understand that equality isn't equity; the difference leads to everyone getting what they need

The Security of Buildings Grahame Underwood,1984

Introduction to Nonparametric Detection with Applications Jerry D. Gibson,James L Melsa,1976-01-22 Even with the advances in signal processing and digital communications, robustness to uncertain channel statistics continues to be a fundamental issue in the design and performance analysis of today's communications, radar, and sonar systems. The variability of digital communications systems consistently challenges the communications system designer, while new applications have channels that almost defy accurate modeling. As a result, parametric detectors, which are excellent when model assumptions are satisfied, do not maintain the satisfactory performance necessary for detection. This core IEEE Press reissue is the only book devoted solely to nonparametric detection - the key to maintaining good performance over a wide range of conditions. Throughout, the authors employ the classical Neyman-Pearson approach, which is widely applicable to detection problems in communications, radar, sonar, acoustics, and geophysics. Topics covered include: nonparametric detection theory, basic detection theory, one-input and two-input detectors and performance, tied observations, dependent sample performance, and engineering applications.

Nanomaterials for the Detection and Removal of Wastewater Pollutants Barbara Bonelli,Francesca S. Freyria,Ilenia Rossetti,Rajandrea Sethi,2020-06-12 Nanomaterials for the Detection and Removal of Wastewater Pollutants assesses the role of nanotechnology and nanomaterials in improving both the detection and removal of inorganic and organic contaminants from wastewater that originates from municipal and industrial plants. The book covers how nanotechnology is being used to remove common contaminants, including dyes, chlorinated solvents, nitrites/nitrates, and emerging contaminants, such as pharmaceuticals, personal care products and pesticides. Sections cover nanofiltration, adsorption and remediation. Nanomaterial immobilization recovery is also addressed, along with the quantification of heat/mass transport limitations, sizing aspects and transport phenomena. Finally, regulatory aspects regarding contaminants and nanoparticles in the environment are covered. This book is an important resource for both materials scientists and environmental scientists looking to see how nanotechnology can play a role in making wastewater a less hazardous part of the global ecosystem. Addresses the role of new nanotechnology-based solutions for the detection and removal of common and emerging contaminants Discusses the environmental impact of nanoparticles used in wastewater contaminant detection and removal Explores the major challenges for using nanomaterials to detect and remove contaminants from wastewater

On Timing-Based Localization in Cellular Radio Networks Kamiar Radnosrati,2018-08-29 The possibilities for positioning in cellular networks has increased over time, pushed by increased needs for location based products and services for a variety of purposes. It all started with rough position estimates based on timing measurements and sector information available in the global system for mobile communication (gsm), and today there is an increased standardization effort to provide more position relevant measurements in cellular communication systems to improve on localization accuracy and availability. A first purpose of this thesis is to survey recent efforts in the area and their potential for localization. The rest of the thesis then investigates three particular aspects, where the focus is on timing measurements. How can these be combined in the best way in long term evolution (lte), what is the potential for the new narrow-band communication links for localization, and can the timing measurement error be more accurately modeled? The first contribution concerns a narrow-band standard in lte intended for internet of things (iot) devices. This lte standard includes a special position reference signal sent synchronized by all base stations (bs) to all iot devices. Each device can then compute several pair-wise time differences that corresponds to hyperbolic functions. Using multilateration methods the intersection of a set of such hyperbolas can be computed. An extensive performance study using a professional simulation environment with realistic user models is presented, indicating that a decent position accuracy can be achieved despite the narrow bandwidth of the channel. The second contribution is a study of how downlink measurements in lte can be combined. Time of flight (tof) to the serving bs and time difference of arrival (tdoa) to the neighboring bs are used as measurements. From a geometrical perspective, the position estimation problem involves computing the intersection of a circle and hyperbolas, all with uncertain radii. We propose a fusion framework for both snapshot estimation and filtering, and evaluate with both simulated and experimental field test data. The results indicate that the position accuracy is better than 40 meters 95% of the time. A third study in the thesis analyzes the statistical distribution of timing measurement errors in lte systems. Three different machine learning methods are applied to the experimental data to fit Gaussian mixture distributions to the observed measurement errors. Since current positioning algorithms are mostly based on Gaussian distribution models, knowledge of a good model for the measurement errors can be used to improve the accuracy and robustness of the algorithms. The obtained results indicate that a single Gaussian distribution is not adequate to model the real toa measurement errors. One possible future study is to further develop standard algorithms with these models.
