*The Chaperone* Laura Moriarty,2012-06-05 Soon to be a feature film from the creators of Downton Abbey starring Elizabeth McGovern, *The Chaperone* is a New York Times-bestselling novel about the woman who chaperoned an irreverent Louise Brooks to New York City in the 1920s and the summer that would change them both. Only a few years before becoming a famous silent-film star and an icon of her generation, a fifteen-year-old Louise Brooks leaves Wichita, Kansas, to study with the prestigious Denishawn School of Dancing in New York. Much to her annoyance, she is accompanied by a thirty-six-year-old chaperone, who is neither mother nor friend. Cora Carlisle, a complicated but traditional woman with her own reasons for making the trip, has no idea what she's in for. Young Louise, already stunningly beautiful and sporting her famous black bob with blunt bangs, is known for her arrogance and her lack of respect for convention. Ultimately, the five weeks they spend together will transform their lives forever. For Cora, the city holds the promise of discovery that might answer the question at the core of her being, and even as she does her best to watch over

Louise in this strange and bustling place she embarks on a mission of her own. And while what she finds isn't what she anticipated, she is liberated in a way she could not have imagined. Over the course of Cora's relationship with Louise, her eyes are opened to the promise of the twentieth century and a new understanding of the possibilities for being fully alive. Drawing on the rich history of the 1920s, '30s, and beyond—from the orphan trains to Prohibition, flappers, and the onset of the Great Depression to the burgeoning movement for equal rights and new opportunities for women—Laura Moriarty's *The Chaperone* illustrates how rapidly everything, from fashion and hemlines to values and attitudes, was changing at this time and what a vast difference it all made for Louise Brooks, Cora Carlisle, and others like them.

*The Origins and History of the All-American Girls Professional Baseball League* Merrie A. Fidler, 2015-05-07 This in-depth treatment of the organization and operation of the All-American Girls Professional Baseball League draws on primary documents from league owner Arthur Meyerhoff and others for a unique perspective inside the AAGPBL. The study begins with a brief history of women's softball, an important precursor to, and talent pool for, women's professional baseball. Next the book investigates league administration and organization as well as publicity and promotion. Later chapters cover team administrative structures, managers, chaperones, player backgrounds, and league policies. Finally, discussion focuses on the activities of the AAGPBL

Players' Association from 1980 onward. Informed by many years of research and insights from former players, this exhaustive history contains 149 photographs.

The Molecular Chaperones Interaction Networks in Protein Folding and Degradation Walid A.

Houry, 2014-09-01 Molecular chaperones are a fundamental group of proteins that have been identified only relatively recently. They are key components of a protein quality machinery in the cell which insures that the folding process of any newly-synthesized polypeptide chain results in the formation of a properly folded protein and that the folded protein is maintained in an active conformation throughout its functional lifetime. Molecular chaperones have been shown to play essential roles in cell viability under both normal and stress conditions. Chaperones can also assist in the unfolding and degradation of misfolded proteins and in disaggregating preformed protein aggregates. Chaperones are also involved in other cellular functions including protein translocation across membranes, vesicle fusion events, and protein secretion. In recent years, tremendous advances have been made in our

understanding of the biology, biochemistry, and biophysics of function of molecular chaperones. In addition, recent technical developments in the fields of proteomics and genomics allowed us to obtain a global view of chaperone interaction networks. Finally, there is now a growing interest in the role of molecular chaperones in diseases. This book will provide a comprehensive analysis of the structure and function of the diverse systems of molecular chaperones and their role in cell stress responses and in diseases from a global network perspective. □

*The Biology of Extracellular Molecular Chaperones* Derek J. Chadwick, Jamie A.

Goode, 2008-04-30 The heat shock, or cell stress, response was first identified in the polytene chromosomes of *Drosophila*. This was later related to the appearance of novel proteins within stressed cells, and the key signal stimulating this appearance was identified as the presence of unfolded proteins within the cell. It is now known that this is a key mechanism enabling cells to survive a multitude of physical, chemical and biological stresses. Since the promulgation of the 'molecular chaperone' concept as a general cellular function to control the process of correct protein folding, a large number of molecular chaperones and protein folding catalysts have been identified, and it has been recognized that not all molecular chaperones are stress proteins and vice versa. The discovery of molecular chaperones as folding proteins went hand-in-hand with their recognition as potent immunogens in microbial infection. It was

subsequently shown that administration of molecular chaperones such as Hsp60, Hsp70 or Hsp90 could inhibit experimental autoimmune diseases and cancer. More recently evidence has accumulated to show that certain molecular chaperones are also present on the surface of cells or in extracellular fluids. A new paradigm is emerging: at least some molecular chaperones are secreted proteins with pro- or anti-inflammatory actions, regulating the immune response in human diseases such as coronary heart disease, diabetes and rheumatoid arthritis. In addition to having direct effects on cells, molecular chaperones can bind peptides and present them to T cells to modulate immune responses. This may be significant in the treatment of cancer. This is the first book bringing leading researchers in this field together to review and discuss: our current knowledge of cell stress response and molecular chaperones the changing paradigms of protein trafficking and function cell stress proteins as immunomodulators and pro- and anti-inflammatory signalling molecules the role of these proteins in various chronic diseases and their potential as preventative or therapeutic agents. The Biology of Extracellular Molecular Chaperones is of particular interest to immunologists, cell and molecular biologists, microbiologists and virologists, as well as clinical researchers working in cardiology, diabetes, rheumatoid arthritis and other inflammatory diseases.

**Endoplasmic Reticulum and Its Role in Tumor Immunity** Paul Eggleton, Marek Michalak, 2016-02-16  
The endoplasmic reticulum (ER) is an organelle crucial to many cellular functions and processes, including the mounting of T-cell immune responses. Indeed, the ER has a well-established central role in anti-tumor immunity. Perhaps best characterized is the role of the ER in the processing of antigen peptides and the subsequent peptide assembly into MHC class I and II molecules. Such MHC/tumor-derived peptide complexes are pivotal for the correct recognition of altered self or viral peptides and the subsequent clonal expansion of tumor-reactive T-cells. In line with the role of the ER in immunity, tumor-associated mutations in ER proteins, as well as ER protein content and localization can have both deleterious and advantageous effects on anti-tumor immune responses. For instance, loss of function of ER-aminopeptidases, that trim peptides to size for MHC, alter the MHC class I - peptide repertoire thereby critically and negatively affecting T-cell recognition. On the other hand, altered localization of ER proteins can have immune-promoting effects. Specifically, translocation of certain ER proteins to the cell surface has been shown to promote anti-tumor T-cell immunity by directing uptake of apoptotic tumor cells to professional antigen presenting cells, thereby facilitating anti-tumor T-cell immunity. These

selected examples highlight a diverse and multi-faceted role of the ER in anti-tumor immunity. Molecular biological insights from the past decade have uncovered that ER components may affect tumor immunity and have invoked a variety of follow-up questions. For instance, how and why are ER proteins over-expressed in tumors? How do nucleotide and somatic mutations in ER chaperones/processing machinery affect the MHC/peptide complex and tumor cell immunogenicity? How do ER-proteins translocate to the cell surface? What if any is the potential role of extracellular ER protein in tumor immunotherapy/vaccines, and can they be delivered to the tumor cell surface by photodynamic therapy, anthracyclines or by other means? In this special research topics issue, we present basic and clinical research reports covering many aspects of ER proteins in cancer recognition by the immune system, therapy and drug development. We also present reports new insights into ER stress, signalling and homeostasis in immunogenic cell death in cancer, the effect of parasitic ER proteins on tumour growth, ER protein regulation of angiogenesis. A comprehensive series of articles highlight our understanding of an expanding avenue of tumour immunology and therapeutic development, which exploit a collection of proteins within the ER that are not obvious candidates for immunity against tumors.
