Recent Advances in Endothelial Progenitor Cells Toward Their Use in Clinical Translation Reinhold J. Medina,David M. Smadja,2020-02-19 Since endothelial progenitor cells (EPCs) were first described in 1997, there has been significant debate surrounding their definition and roles; but also agreement in their potential to develop as biomarkers and cytotherapies. EPCs participate in vascular repair and postnatal angiogenesis by differentiating into endothelial cells or by producing pro–angiogenic growth factors. Various subtypes of EPCs have been studied, such as CD34+VEGFR2+ blood circulating cells, cultured endothelial colony forming cells (ECFCs), and myeloid angiogenic cells (MACs). EPCs have therapeutic potential for revascularisation and vascular repair in ischemic diseases such as myocardial infarction and diabetic vascular complications. In this eBook, we compile evidence to enable their translation including strategies to enhance the number, homing ability to the injury site and function of EPCs.
