Mariano Martín Martín

Industrial Chemical Process Analysis and Design Mariano Martín
Martín, 2016-07-02 Industrial Chemical Process Analysis and Design uses chemical engineering principles to explain the transformation of basic raw materials into major chemical products. The book discusses traditional processes to create products like nitric acid, sulphuric acid, ammonia, and methanol, as well as more novel products like bioethanol and biodiesel. Historical perspectives show how current chemical processes have developed over years or even decades to improve their yields, from the discovery of the chemical reaction or physico-chemical principle to the industrial process needed to yield commercial quantities. Starting with an introduction to process design, optimization, and safety, Martin then provides stand-alone chapters—in a case study fashion—for commercially important chemical production processes. Computational software tools like MATLAB®, Excel, and Chemcad are used throughout to aid process analysis. Integrates principles of chemical engineering, unit operations, and chemical reactor engineering to understand process synthesis and analysis Combines traditional computation and modern software tools to compare different solutions for the same problem Includes historical perspectives and traces the improving efficiencies of commercially important chemical production processes Features worked examples and end-of-chapter problems with solutions to show the application of concepts discussed in the text

Recommendations for Design and Analysis of Earth Structures using Geosynthetic Reinforcements - EBGE0

Deutsche Gesellschaft für Geotechnik, 2012-01-09 The completely revised and extended Recommendations deal with all questions relevant to the planning and dimensioning of geosynthetic-reinforced earth structures. In addition to the demands on materials and analysis principles, the applications of geosynthetics in a range of foundation systems, ground improvement measures, highways engineering projects, in slopes and retaining structures, and in landfill engineering are discussed. The Recommendations have been supplemented by the following sections: - reinforced earth structures over point or linear bearing elements, - foundation systems using geotextile-encased columns, - bridging subsidence, - dynamic actions of geosynthetic-reinforced systems. The remaining sections have been fundamentally revised and updated in line with current standards and codes of practice.

Rethinking Asia Samuel Hungsoo Kim, 2020 Our world today is becoming ever more complex, colored with uncertainty, tensions, and fragmentation. Old ways of thinking and acting are insufficient to deal with the many challenges we face today. We need new habits, perspectives, and priorities to navigate our world's uncharted paths and to respond effectively to the obstacles ahead of us. Strong leaders in the future will require multiple-angle observation skills, encompassing both the bird's-eye view and the perspectives on the

ground. They will also need the confidence, knowledge, and skill to take bold actions that will turn the course of our destiny upward, shifting our current, challenging realities to the hopeful aspirations of tomorrow. Leadership in this regard is about making progress, a movement toward what is better, safer, and more prosperous for all of us, even in the face of new and overwhelming difficulties. In *Rethinking Asia 6: How Leadership Can Be Taught*, eight CALI faculty members share their insights and practices on teaching leadership, encompassing both their ideas for positive change and their pedagogical theories on how leadership can be learned and exercised, using their personal and professional experiences as examples and cautionary tales. Showcasing frameworks taught at Harvard's various graduate schools, this book provides readers with an opportunity to think more deeply and systematically about change, power, influence, and leadership, and to increase their own capacities as leaders and agents of change--
