The New Global Ecosystem in Advanced Computing National Research Council,Policy and Global Affairs,Board on Global Science and Technology,Committee on Global Approaches to Advanced Computing,2012-11-23 Computing and information and communications technology (ICT) has dramatically changed how we work and live, has had profound effects on nearly every sector of society, has transformed whole industries, and is a key component of U.S. global leadership. A fundamental driver of advances in computing and ICT has been the fact that the single-processor performance has, until recently, been steadily and dramatically increasing year over years, based on a combination of architectural techniques, semiconductor advances, and software improvements. Users, developers, and innovators were able to depend on those increases, translating that performance into numerous technological innovations and creating successive generations of ever more rich and diverse products, software services, and applications that had profound effects across all sectors of society. However, we can no longer depend on those extraordinary advances in single-processor performance continuing. This slowdown in the growth of single-processor computing performance has its roots in fundamental physics and engineering constraints-multiple technological barriers have converged to pose deep research challenges, and the consequences of this shift are deep and profound for computing and for the sectors of the economy that depend on and assume, implicitly or explicitly, ever-increasing performance. From a technology standpoint, these challenges have led to heterogeneous multicore chips and a shift to alternate innovation axes that include, but are not limited to, improving chip performance, mobile devices, and cloud services. As these technical shifts reshape the computing industry, with global consequences, the United States must be prepared to exploit new opportunities and to deal with technical challenges. The New Global Ecosystem in Advanced Computing: Implications for U.S. Competitiveness and National Security outlines the technical challenges, describe the global research landscape, and explore implications for competition and national security.

Succeed In Software Sean Cannon,2023-01-05 Attention coders! Are you earning less than $300,000 per year as a software engineer? Have you been grinding away as a junior or mid-level developer for too long and the promotions aren't coming? Have you recently completed a coding boot camp and now you're in the deep end with no clear direction on how to advance your career? This book can help you master the skills necessary to stand out at the top of our field. While you wait for your next annual review, you are helping to make your executive team rich while they pay you an entry-level salary and consider you nothing more than a replaceable cog in the machine. Over the past 20 years working as a software professional, I have been collecting extremely valuable lessons that have helped me become one of the highest-paid, most reliable developers in my network. I no longer worry about money, I no longer work overtime, and instead of competing with my peers for promotions, I now have companies competing with each other for my time and skillset. You don't need a college degree and you don't need to master a bunch of programming languages or become an expert at all the new libraries and frameworks to get where I am. That is a waste of time, and money, and all you are doing is helping other people realize their goals instead of realizing your own. The career ladder is simply a game of profits and resources, and once you learn and understand how the people above you perceive value, and who your clients really are, you will soar past your colleagues. If you don't want to spend years crawling your way to the top on your own like I did, working twice as hard as everybody else just to get noticed for promotions, then let me help you cut those years or even decades off that journey – it's time to take control of your software career and kick it into high gear right now.

Making Globally Distributed Software Development a Success Story Qing Wang,Dietmar Pfahl,David Raffo,2008-05-06

This volume contains papers presented at the International Conference on Software Process (ICSP 2008) held in Leipzig, Germany, during May 10-11, 2008. ICSP 2008 was the second conference of the ICSP series. The theme of ICSP 2008 was "Making Globally Distributed Software Development a Success Story. " Software developers work in a dynamic context of frequently changing technologies and with limited resources. Globally distributed development teams are under ev- increasing pressure to deliver their products more quickly and with higher levels of qu- ity. At the same time, global competition is forcing software development organizations to cut costs by rationalizing processes, outsourcing part of or all development activities, reusing existing software in new or modified applications, and evolving existing systems to meet new needs, while still minimizing the risk of projects failing to deliver. To address these difficulties, new and modified processes are emerging, including agile methods and plan-based product line development. Open Source, COTS, and com- nity-developed software are becoming more and more popular. Outsourcing coupled with 24/7 development demands well-defined processes to support the coordination of organizationally—and geographically—separated teams. The accepted papers present completed research or advanced work-in-progress in all areas of software and systems development process including: agile software pr- esses, CMMI, novel techniques for software process representation and analysis; process tools and metrics; and the simulation and modeling of software processes. Contributions reflecting real-world experience, or derived directly from industrial or open-source software development and evolution, were particularly welcome.
