Agricultural transformation: trends in farm size, crop diversification and mechanization in Nicaragua and Peru Srinivasan, S.V., Saborío, M., Morales Opazo, C., 2022-09-02 Structural change is a process in which the amount of labour, capital and land dedicated to agriculture (and other sectors) changes over time. In this study, we focus on the cases of Peru and Nicaragua using their two most recently administered agricultural censuses. The agricultural censuses permit us to identify dimensions and information available to study the process of structural change in Latin America over the last 20 years. The study includes a comparative analysis and policy recommendations based on the two most recent agricultural censuses administered in Nicaragua (2001 and 2011) and Peru (1994 and 2012). Processing and analysing information from these censuses contribute to identifying dimensions and information available to study the process of structural change in Latin America over the last 20 years. Evidence-based policymaking is increasingly more at the core of the United Nations and member countries' activity. In the case of FAO, this type of study is crucial to build the knowledge body on which projects and activities are carried forward. The Hand-in-Hand (HiH) initiative is a key example in this context, as it aims at quantitatively identifying high-impact and high-agricultural potential areas in which to invest within developing countries. As Nicaragua and Peru are HiH's target countries, this study will show very useful to learn about their recent experiences in agricultural

transformations.

Crop Production ,1999

Crop Improvement Khalid Rehman Hakeem,Parvaiz Ahmad,Munir Ozturk,2013-06-13 The improvement of crop species has been a basic pursuit since cultivation began thousands of years ago. To feed an ever increasing world population

will require a great increase in food production. Wheat, corn, rice, potato and few others are expected to lead as the most important crops in the world. Enormous efforts are made all over the world to document as well as use these resources. Everybody knows that the introgression of genes in wheat provided the foundation for the “Green Revolution”. Later also demonstrated the great impact that genetic resources have on production. Several factors are contributing to high plant performance under different environmental conditions, therefore an effective and complementary use of all available technological tools and resources is needed to meet the challenge.

Phosphorus Management in Crop Production Nand Kumar Fageria,Zhenli He,Virupax C. Baligar,2017-02-17 The world population is projected to reach nine billion by 2050, and in the coming years, global food demand is expected to increase by 50% or more. Higher crop productivity gains in the future will have to be achieved in developing countries through better natural resources management and crop improvement. After nitrogen, phosphorus (P) has more widespread influence on both natural and agricultural ecosystems than any other essential plant element. It has been estimated that 5.7 billion

hectares of land worldwide contain insufficient amounts of available P for sustainable crop production, and P deficiency in crop plants is a widespread problem in various parts of the world. However, it has been estimated that worldwide minable P could last less than 40 years. For sustaining future food supplies, it is vital to enhance plant P use efficiency. To bring the latest knowledge and research advances in efficient management of P for economically viable and environmentally beneficial crop production in sustainable agriculture, Phosphorus Management in Crop Production contains chapters covering functions and diagnostic techniques for P requirements in crop plants, P use efficiency and interactions with other nutrients in crop plants, management of P for optimal crop production and environmental quality, and basic principles and methodology regarding P nutrition in crop plants. The majority of research data included are derived from many years of field, greenhouse, and lab work, hence the information is practical in nature and will have a significant impact on efficient management of P-fertilizers to enhance P use efficiency, improve crop production, promote sustainable agriculture, and reduce P losses through eluviations, leaching, and erosion to minimize environmental degradation. A comprehensive book that combines practical and applied information, Phosphorus Management in Crop Production is an excellent reference for students, professors, agricultural research scientists, food scientists, agricultural extension specialists, private consultants, fertilizer companies, and government agencies that deal with

agricultural and environmental issues.

Underutilised Crop Genomes Mark A. Chapman, 2022-11-03 This book highlights the uses for underutilized crops, presenting the state-of-the-art in terms of genome sequencing for over 30 crops, previously understudied and under-researched. In a changing climate and with significant pressure on the land, it is the ideal time to be discussing novel crops, with significant biotic and abiotic tolerances and/or rich nutrient profiles for consumers. Previously, the only species with sequenced genomes were high-profile internationally recognized crops, but in the current era genomes are being sequenced for dozens of crops, including those previously classified as underutilized, now being investigated. This book covers food crops, from fruits to tubers, and from grasses to legumes, as well as crops with non-food applications. Some of these crops have draft genomes, and others have polished genomes with extensive resequencing panels. Each chapter tells the story of an individual crop or crop group, written by experts, focusing on the genome data available, revealing more about crop domestication and genetic variation, and the current and future prospects given that this data is now becoming available. It also highlights how even small sequencing projects can provide draft genome sequences suitable for gene discovery, comparative genomics, and identification of molecular markers for

understanding these crops further.

Polyploidy and Hybridization for Crop Improvement Annaliese S.

Mason, 2017-11-22 Many of our current agricultural crops are natural or agricultural hybrids (between two or more species), or polyploids (containing more than one genome or set of chromosomes). These include potato, oats, cotton, oilseed rape, wheat, strawberries, kiwifruit, banana, seedless watermelon, triticale and many others. Polyploidy and hybridization can also be used for crop improvement: for example, to introgress disease resistance from wild species into crops, to produce seedless fruits for human consumption, or even to create entirely new crop types. Some crop genera have hundreds of years of interspecific hybridization and ploidy manipulation behind them, while in other genera use of these evolutionary processes for crop improvement is still at the theoretical stage. This book brings together stories and examples by expert researchers and breeders working in diverse crop genera, and details how polyploidy and hybridization processes have

shaped our current crops, how these processes have been utilized for crop improvement in the past, and how polyploidy and interspecific hybridization can be used for crop improvement in the future.
