Contextualizing Health and Aging in the Americas William A. Vega,Jacqueline L. Angel,Luis Miguel F. Gutiérrez Robledo,Kyriakos S. Markides,2018-09-22 This book presents new insights into the consequences of the impending growth in and impact of the older segment of Latino aging adults across distinctive regions of the Americas. It uses a comparative research framework to further understanding of current issues in health and aging in the transnational context of the health and migratory experiences of the U.S.- Mexican population. It provides an important contribution to the interdisciplinary investigation of chronic diseases and functional impairments, social care and medical services, care-giving and intervention development, and neighborhood factors supporting optimal aging, using new conceptual and methodological approaches (inter-group comparisons). Specifically, the chapters employ different methodologies that investigate trends in aging health and services related to immigration processes, family and household structure, macroeconomic changes in the quality of community life, and focus on the new realities of aging in Latino families in local communities. The book focuses on measurement, data-quality issues, new conceptual modeling techniques, and longitudinal survey capabilities, and suggests needed areas of new research. As such it is of interest to researchers and policy makers in a wide range of disciplines from social and behavioral sciences to economics, gerontology, geriatrics, and public health.

Processing, second edition Casey Reas,Ben Fry,2014-12-19 The new edition of an introduction to computer programming within the context of the visual arts, using the open-source programming language Processing; thoroughly updated throughout. The visual arts are rapidly changing as media moves into the web, mobile devices, and architecture. When designers and artists learn the basics of writing software, they develop a new form of literacy that enables them to create new media for the present, and to imagine future media that are beyond the capacities of current software tools. This book introduces this new literacy by teaching computer programming within the context of the visual arts. It offers a comprehensive reference and text for Processing (www.processing.org), an open-source programming language that can be used by students, artists, designers, architects, researchers, and anyone who wants to program images, animation, and interactivity. Written by Processing's cofounders, the book offers a definitive reference for students and professionals. Tutorial chapters make up the bulk of the book; advanced professional projects from such domains as animation, performance, and installation are discussed in interviews with their creators. This second edition has been thoroughly updated. It is the first book to offer in-depth coverage of Processing 2.0 and 3.0, and all examples have been updated for the new syntax. Every chapter has been revised, and new chapters introduce new ways to work with data and geometry. New “synthesis” chapters offer discussion and worked examples of such topics as sketching with code, modularity, and algorithms. New interviews have been added that cover a wider range of projects. “Extension” chapters are now offered online so they can be updated to keep pace with technological developments in such fields as computer vision and electronics. Design of Embedded Control Systems Marian Andrzej Adamski, Andrei Karatkevich, Marek Wegrzyn, 2005-06-28 A set of original results in the field of high-level design of logical control devices and systems is presented in this book. These concern different aspects of such important and long-term design problems, including the following, which seem to be the main ones. First, the behavior of a device under design must be described properly, and some adequate formal language should be chosen for that. Second, effective algorithmss should be used for checking the prepared description for correctness, for its syntactic and semantic verification at the initial behavior level. Third, the problem of logic circuit implementation must be solved using some concrete technological base; efficient methods of logic synthesis, test, and verification should be developed for that. Fourth, the task of the communication between the control device and controlled objects (and maybe between different control devices) waits for its solution. All these problems are hard enough and cannot be successfully solved without efficient methods and algorithms oriented toward computer implementation. Some of these are described in this book. The languages used for behavior description have been descended usually from two well-known abstract models which became classic: Petri nets and finite state machines (FSMs). Anyhow, more detailed versions are developed and described in the book, which enable to give more complete information concerning specific qualities of the regarded systems. For example, the model of parallel automaton is presented, which unlike the conventional finite automaton can be placed simultaneously into several places, called partial. As a base for circuit implementation of control algorithms, FPGA is accepted in majority of cases.
