### **Evaluation of Some SMTP Testing, Email Verification, Header Analysis, SSL Checkers, Email Delivery, Email Forwarding and WordPress Email Tools** Dr. Hidaia Mahmood

Alassouli,2023-07-01 Simple Mail Transfer Protocol (SMTP) is a set of rules used while sending emails. Usually, this protocol is associated with IMAP or POP3. However, SMTP is utilized to deliver messages, while POP3 and IMAP are utilized to receive them. The SMTP testing tool identifies issues with email security in your server that can hinder your email delivery. It checks the health status of your outgoing email server and notifies you about the detected problems, such as connectivity issues, and how to tackle them. An SMTP test tool can identify SMTP server issues and troubleshoot them to keep your email secure and safe. SSL certificates are what enable websites to use HTTPS, which is more secure than HTTP. An SSL certificate is a data file hosted in a website's origin server. SSL certificates make SSL/TLS encryption possible, and they contain the website's public key and the website's identity, along with related information. Devices attempting to communicate with the origin server will reference this file to obtain the public key and verify the server's identity. The private key is kept secret and secure. The SSL Checker tool can verify that the SSL Certificate on your web server is properly installed and trusted. Email headers are present on every email you receive via the Internet. The email header is generated by the client mail program that first sends it and by all the mail servers on route to the destination. Each node adds more text, including from/to addresses, subject, content type, time stamp and identification data. You can trace the path of the message from source to destination by reviewing the email header text. Header Analyzers can help you view and analyze message headers by displaying the information in a user-friendly manner and also by calling out various issues, such as suspected delivery delays that may require your attention.

Microsoft Remote Connectivity Analyzer provides many tests, including tests for Inbound and outbound SMTP emails. The Inbound SMTP Email test shows you the various steps taken by an email server to send your domain an inbound SMTP email. Similarly, an Outbound SMTP Email test finds out your outbound IPs for some requirements. It includes Reverse DNS, RBL checks, and Sender ID.
