Night Passages Elisabeth Bronfen,2013 In the beginning was the night. All light, shapes, language, and subjective consciousness, as well as the world and art depicting them, emerged from this formless chaos. In fantasy, we seek to return to this original darkness. Particularly in literature, visual representations, and film, the night resiliently resurfaces from the margins of the knowable, acting as a stage and state of mind in which exceptional perceptions, discoveries, and decisions play out. Elisabeth Bronfen follows nocturnal spaces in which extraordinary events unfold, enabling the irrational exploration of desire, transformation, ecstasy, transgression, spiritual illumination, and moral choice. She begins with classical myths depicting the creation of the world and moves through nocturnal scenes in Shakespeare and Milton, Gothic figurations, Hegel's romantic philosophy, and Freud's psychoanalysis. In modern times, she shows how literature and film, particularly film noir, transmit that piece of night the modern subject carries within. From Mozart's Queen of the Night to Virginia Woolf 's oscillation between day and night, life and death, and chaos and aesthetic form, Bronfen renders something visible, conceivable, and tellable from the dark realms of the unknown.

Innovations in Neural Information Paradigms and Applications Monica Bianchini,Marco Maggini,Franco Scarselli,2009-10-16 Tremendous advances in all disciplines including engineering, science, health care, business, avionics, management, and so on, can also be attributed to the development of artificial intelligence paradigms. In fact, researchers are always interested in desi- ing machines which can mimic the human behaviour in a limited way. Therefore, the study of neural information processing paradigms have generated great interest among researchers, in that machine learning, borrowing features from human intelligence and applying them as algorithms in a computer friendly way, involves not only Mathem- ics and Computer Science but also Biology, Psychology, Cognition and Philosophy (among many other disciplines). Generally speaking, computers are fundamentally well-suited for performing au- matic computations, based on fixed, programmed rules, i.e. in facing efficiently and reliably monotonous tasks, often extremely time-consuming from a human point of view. Nevertheless, unlike humans, computers have troubles in understanding specific situations, and adapting to new working environments. Artificial intelligence and, in particular, machine learning techniques aim at improving computers behaviour in tackling such complex tasks. On the other hand, humans have an interesting approach to problem-solving, based on abstract thought, high-level deliberative reasoning and pattern recognition. Artificial intelligence can help us understanding this process by recreating it, then potentially enabling us to enhance it beyond our current capabilities.
