Decrypting the Encryption Debate National Academies of Sciences, Engineering, and Medicine, Division on Engineering and Physical Sciences, Computer Science and Telecommunications Board, Committee on Law Enforcement and Intelligence Access to Plaintext Information, 2018-06-07 Encryption protects information stored on smartphones, laptops, and other devices - in some cases by default. Encrypted communications are provided by widely used computing devices and services - such as smartphones, laptops, and messaging applications - that are used by hundreds of millions of users. Individuals, organizations, and governments rely on encryption to counter threats

from a wide range of actors, including unsophisticated and sophisticated criminals, foreign intelligence agencies, and repressive governments. Encryption on its own does not solve the challenge of providing effective security for data and systems, but it is an important tool. At the same time, encryption is relied on by criminals to avoid investigation and prosecution, including criminals who may unknowingly benefit from default settings as well as those who deliberately use encryption. Thus, encryption complicates law enforcement and intelligence investigations. When communications are encrypted end-to-end, intercepted messages cannot be understood. When a smartphone is locked and encrypted, the contents cannot be read if the phone is seized by investigators. Decrypting the Encryption Debate reviews how encryption is used, including its applications to cybersecurity; its role in protecting privacy and civil liberties; the needs of law enforcement and the intelligence community for information; technical and policy options for accessing plaintext; and the international landscape. This book describes the context in which decisions about providing authorized government agencies access to the plaintext version of encrypted information would be made and identifies and characterizes possible mechanisms and alternative means of obtaining information.

Cracking Codes with Python Al Sweigart,2018-01-23 Learn how to program in Python while making and breaking

ciphers—algorithms used to create and send secret messages! After a crash course in Python programming basics, you'll learn to make, test, and hack programs that encrypt text with classical ciphers like the transposition cipher and Vigenère cipher. You'll begin with simple programs for the reverse and Caesar ciphers and then work your way up to public key cryptography, the type of encryption used to secure today's online transactions, including digital signatures, email, and Bitcoin. Each program includes the full code and a line-by-line explanation of how things work. By the end of the book, you'll have learned how to code in Python and you'll have the clever programs to prove it! You'll also learn how to: - Combine loops, variables, and flow control statements into real working programs - Use dictionary files to instantly detect whether decrypted messages are valid English or gibberish - Create test programs to make sure that your code encrypts and decrypts correctly - Code (and hack!) a working example of the affine cipher, which uses modular arithmetic to encrypt a message - Break ciphers with techniques such as brute-force and frequency analysis There's no better way to learn to code than to play with real programs. Cracking Codes with Python makes the learning fun!

Essential Readings in Wildlife Management and Conservation Paul R. Krausman, Bruce D. Leopold, 2013-03-15
Published in association with The Wildlife Society.

Cities, Space and Power Amira Osman, 2020-12-31 The scholarly purpose of this manuscript is to provide a resource for academics and researchers looking into cities, space and power in emerging economies. It also takes into consideration the relationship between emerging economies and developing contexts, as well as the lessons that may be shared between them. This book presents a unique perspective and aims to highlight issues not addressed much in

writing on the built environment. Based on substantiation and references to numerous other sources and authors, alternative theoretical frameworks for the study of the built environment are developed. This is a very relevant contribution at this time, especially as cities will most probably go through transformations in the post-COVID-19 era. Our first line of defense against this public health crisis will be in areas of poverty, with people who have generally been excluded and urban practices that have been undocumented or labeled as informal. The main thesis of the manuscript is that space and power are strongly linked in cities. The research results prevalent in the book are original, and while the authors consult widely across disciplines, the themes are firmly rooted in the built environment fields – with a focus on the architectural discipline.
