Music at the Edge Colin Andrew Lee,2016-06-03 Music at the Edge invites the reader to experience a complete music therapy journey through the words and music of the client, and the therapist's reflections. Francis, a musician living with AIDS, challenged Colin Andrew Lee, the music therapist, to help clarify his feelings about living and dying. The relationship that developed between them enabled Francis the opportunity to reconsider the meaning of his life and subsequent physical decline, within a musical context. First published in 1996, Music at the Edge is a unique and compelling music therapy case study. In this new edition of the highly successful book, Colin retains the force of the original text through the lens of contemporary music therapy theory. This edition also includes more detailed narrative responses from the author and his role as a therapist and gay man. Central to the book are the audio examples from the sessions themselves. The improvisations Francis played and his insightful verbal explorations provide an extraordinary glimpse into the therapeutic process when working in palliative and end-of-life care. This illuminating book offers therapists, musicians, related professionals and those working with, or facing, illness and death a unique glimpse into the transcendent powers of music. It is also relevant to anyone interested in the creative account of a pianist's discovery of life and death through music.

Spatial Audio Reproduction with Primary Ambient Extraction JianJun He,2016-07-25 This book first introduces the background of spatial audio reproduction, with different types of audio content and for different types of playback systems. A literature study on the classical and emerging Primary Ambient Extraction (PAE) techniques is presented. The emerging techniques aim to improve the extraction performance and also enhance the robustness of PAE approaches in dealing with more complex signals encountered in practice. The in-depth theoretical study helps readers to understand the rationales behind these approaches. Extensive objective and subjective experiments validate the feasibility of applying PAE in spatial audio reproduction systems. These experimental results, together with some representative audio examples and MATLAB codes of the key algorithms, illustrate clearly the differences among various approaches and also help readers gain insights on selecting different approaches for different applications.

Audio Source Separation Shoji Makino,2018-03-01 This book provides the first comprehensive overview of the fascinating topic of audio source separation based on non-negative matrix factorization, deep neural networks, and sparse component analysis. The first section of the book covers single channel source separation based on non-negative matrix factorization (NMF). After an introduction to the technique, two further chapters describe separation of known sources using non-negative spectrogram factorization, and temporal NMF models. In section two, NMF methods are extended to multi-channel source separation. Section three introduces deep neural network (DNN) techniques, with chapters on multichannel and single channel separation, and a further chapter on DNN based mask estimation for monaural speech separation. In section four, sparse component analysis (SCA) is discussed, with chapters on source separation using audio directional statistics modelling, multi-microphone MMSE-based techniques and diffusion map methods. The book brings together leading researchers to provide tutorial-like and in-depth treatments on major audio source separation topics, with the objective of becoming the definitive source for a comprehensive, authoritative, and accessible treatment. Machine Learning and Music Generation José M. Iñesta,Darrell C. Conklin,Rafael Ramírez-Melendez,Thomas M. Fiore,2018-10-16 Computational approaches to music composition and style imitation have engaged musicians, music scholars, and computer scientists since the early days of computing. Music generation research has generally employed one of two strategies: knowledge-based methods that model style through explicitly formalized rules, and data mining methods that apply machine learning to induce statistical models of musical style. The five chapters in this book illustrate the range of tasks and design choices in current music generation research applying machine learning techniques and highlighting recurring research issues such as training data, music representation, candidate generation, and evaluation. The contributions focus on different aspects of modeling and generating music, including melody, chord sequences, ornamentation, and dynamics. Models are induced from audio data or symbolic data. This book was originally published as a special issue of the Journal of Mathematics and Music.
