110 Waveform Generator Projects for the Home Constructor R. M. Marston,2016-03-16 110

Waveform Generator Projects for the Home Constructor deals with waveform generator circuits that can produce forms of sine, square, triangle, sawtooth, ramp, pulse, or staircase. The generator circuits, built by the constructor using transistors, operational amplifiers or digital integrated circuits, can produce modulated or unmodulated outputs, with single or multiple form outputs. The constructor must follow two requirements in building a simple sine-wave oscillator: firstly, the output of an amplifying device must be fed back to its input via a frequency-selective network in such a way that the sum of the amplifier and feedback network phase-shifts equals zero (or 360) degrees at the desired oscillation frequency. Secondly, the gain of the amplifying device must exactly counter the loss or attenuation of the frequency-selective feedback network at the desired oscillation frequency, to give an overall system gain of precise unity. The book also describes different waveform modulations, such as amplitude modulation (a.m.), frequency modulation (f.m.), frequency-shift keying (f.s.k.), phase-shift keying (p.s.k.), sweep modulation, carrier keying, and how to apply these in practical circuits. Radio technicians, engineers, apprentices, hobbyists, and students of electrical engineering or electronics will find the book very useful.

*Superhigh Frequency Generators of Plasma* V. M. Batenin,Ivan I. Klimovskii,Georgi V.

Lysov,Vladimir N. Troitskii,1993-10-25 Superhigh Frequency Generators of Plasma describes the

basic physical processes defining the properties and characteristics of SHF-discharges at pressures from 100 Pa to atmospheric. It provides a detailed analysis of propagation mechanisms of the discharge front in atomic and molecular gases, and it examines specific forms of discharges in external magnetic fields and under conditions of combined effect by SHF- and dc-electric fields. Methods for calculating the intensity of electric SSHF-fields and their energy efficiency in a plasma for different schemes of SHF-plasma generators are described. The book incorporates examples demonstrating the possibilities of utilizing SHF-discharges in modern technology, including one illustrating the preparation of finely divided powders of titanium, zirconium, and hafnium nitrides. Superhigh Frequency Generators of Plasma will benefit researchers and engineers dealing with the physics of plasma and plasma technologies, in addition to students interested in the topic.

### **Application of RF Micropotentiometers for Calibration of Signal Generators to 1000 Mc**

Lewis F. Behrent,1960 With the RF micro-potentiometer, signal generator output voltage can be calibrated to 1000 Mc simply and accurately if the procedures outlines in this paper are carefully followed. The sources of error are discussed and methods for minimizing or eliminating them are described. Topics discussed include: RF shielding, selection of a suitable RF detector, impedance matching and the proper selection of voltage reference planes.
