Apoptosis Ning Yang, Inge Swie Goping, 2013-04-01 Multi-cellular organisms eliminate individual cells through a self-destruct process known as apoptosis. Apoptosis is critical for proper development and maintenance of tissue homeostasis. The importance of this process is highlighted by the fact that too much or too little apoptosis is the underlying cause of pathologies such as cancer, autoimmune diseases (e.g., lupus, arthritis), and neurodegenerative disorders (e.g., Parkinson's, Alzheimer's). In the early days, apoptotic cells were identified strictly by cell morphology. Now we know that biochemical signatures define a number of death programs, of which apoptosis is the most widely understood. In this review, we discuss genetic insights gained from *C. elegans*, the importance of caspases, engulfment of apoptotic cells, apoptotic signals, the role of mitochondria, the Bcl-2 family, and the link between dysfunctional apoptosis and disease. Within each topic, we highlight landmark studies that contributed to our current understanding of apoptosis. All together, this research exemplifies tremendous scientific synergy between the disciplines of genetics, biochemistry, developmental cell biology, and structural biology. Continued exploration into mechanisms that regulate apoptosis will undoubtedly lead to insights into disease processes with potential therapeutic strategies.

Resin Microscopy and On-Section Immunocytochemistry Geoffrey R. Newman, Jan A. Hobot, 2012-12-06 Since antibodies tagged with markers have been developed, immunocytochemistry has become an important method for identifying tissue substances and the localisation of nucleic acid in tissue by in situ hybridisation in molecular biology. This laboratory book covers the embedding of tissue using less sensitive epoxy resin methods to the more sensitive procedures employing the acrylics. The possibilities are discussed and results are presented so that an understanding of the techniques can be acquired.

Mechanisms of Transcriptional Regulation for the Rat Carbamyl Phosphate Synthetase I Gene [microform] Ing Swie Goping, 1994

Mechanisms of Transcriptional Regulation for the Rat Carbamyl Phosphate Synthetase I Gene Ing Swie Goping, 1994 The proximal promoter of the rat carbamyl phosphate synthetase I gene contains 4 cis-acting regulatory regions, designated sites GAC, I, II, and III. Transient transfection assays revealed that the GAG element functions as the main activator element, whereas sites I and III bind repressor proteins and site II binds an anti-repressor. We propose that sites I and III repress the CPS I promoter either by quenching the sole activator(s) bound to the GAG element, or by directly repressing the basal transcription apparatus. Footprint analyses of the promoter with and without a mutation within site II suggested that the site

II-anti-repressor may interfere with the site I and site III repressors by a similar quenching mechanism. Although the elements within the proximal promoter exhibit the potential for complex regulation, they are unable to confer tissue-specific promoter activity when analyzed either by in vitro transcription employing nuclear extracts from tissues that do not express the endogenous gene (i.e. brain, kidney, and spleen), or by transient transfection assays in non-CPS I-expressing cells (i.e. Rat1 and C6). However, we identified a cell-type specific enhancer that lies 10 kb upstream of the promoter. Unexpectedly, the enhancer functions as well in a gene-specific manner because enhancer-stimulated promoter activity was exclusively dependent on the GAG element within the CPS I proximal promoter. As a result, the GAG element is required to couple enhancer activity to the proximal promoter and exemplifies an efficient method whereby enhancers can be constrained to activate only their cognate promoters. --

Genetics of Apoptosis Stefan Grimm, 2003-12-16 Apoptosis is an essential process in embryonic development and tissue homeostasis, particularly in the prevention of disease. Written from a genetic viewpoint, Genetics of Apoptosis first describes the molecular and cell biology of apoptosis, then examines the process in more detail in several model systems. This volume brings together contributions from internationally renowned authors, and will be a valuable reference to all researchers studying apoptosis.

Gene Expression and Control Fumiaki Uchiyama,2019-04-17 Transcription is the most fundamental nuclear event, by which the information of nucleotide sequences on DNA is transcribed into RNA by multiple proteins, including RNA polymerases. Transcription determines the functions of proteins and the behaviour of cells, appropriately responding to environmental changes. This book is intended for scientists, especially those who are interested in the future prospect of gene expression and control in medicine and industry. This book consists of 9 chapters, divided into four parts. Each chapter is written by experts both in the basic and applied scientific field. A collection of articles presented by active and laboratory-based investigators provides evidence from the research, giving us a rigid platform to discuss Gene Expression and Control.
