Tropical Forest Ecosystem Responses to Increasing Nutrient Availability Jürgen Homeier, Selene Báez, Dietrich Hertel, Christoph

Leuschner, 2017-09-08 Deforestation and land use change have led to a strong reduction of tropical forest cover during the last decades. Climate change will amplify the pressure to the remaining refuges in the next years. In addition, tropical regions are facing increasing atmospheric inputs of nutrients, which will have unknown consequences for the structure and functioning of these systems, no matter if they are within protected areas or not. Even remote areas are expected to receive rising amounts of nutrients. The effects of higher rates of atmospheric nutrient deposition on the biological diversity and ecosystem functioning of tropical ecosystems are poorly understood and our knowledge of nutrient fluxes and nutrient limitation in tropical forest ecosystems is still limited. Yet, it will be of paramount importance to know the effects of increased nutrient availability to conserve these ecosystems with their biological and functional diversity. During the last years, research efforts have more and more focused on the understanding of the role of nutrients in tropical ecosystems and several coordinated projects have been established that study the effects of experimental nutrient addition. This Research Topic combines results from experiments and from observational studies with the aim to review and conclude on our current knowledge on the role of additional nutrients in ecosystems.

Liver Tissue Engineering Based on Poly (ethylene Glycol) Hydrogels Wonjae Lee, 2010 Use of hydrogels as a scaffold material for engineered tissues has been of increasing interest due to their structural similarity to the extracellular components in the body. Photopolymerizable poly(ethylene glycol) (PEG) is one of the most extensively utilized hydrogels, because its network structure can be easily modified to mimic critical aspects of the original microenvironments and its patternability by photolithography or microfluidic devices allows microarchitectures to guide cells' behavior with respect to morphology, cytoskeletal structure, and functionality. However, due to its complicated microenvironments designed to perform the broad range of hepatic functions, development of an engineered liver tissue has been challenging. The three aspects of tissue's microenvironments, which were critical to design PEG-based engineered livers, were addressed. The first aspect was to understand interaction between the PEG network and incorporated cells. Even though the survivability of encapsulated cells was known to depend on diffusion conditions, insufficient understanding of the structure of cell-encapsulated PEG networks has limited development of new networks with improved permeability to support metabolic activities of encapsulated cells. Since network defects have been identified as up to orders of magnitude larger than the mesh size, we suggest that the level of network defects is a primary determinant of hydrogel permeability and its consequent ability to support metabolic activities of encapsulated cells. We therefore sought a way to purposefully augment the network defects by incorporating hydrophobic poly(lactic-co-glycolic acid) (PLGA) nanoparticles, which induce loose crosslinking at the particle-PEG interface. The efficiency of the proposed design strategy was verified by the improved viability and hepatic functions of encapsulated human liver-derived cells. The second aspect was to recapitulate key aspects of tissue architecture. In the liver, and many other tissues also, different types of cells distribute with specific configurations and their interactions are of fundamental importance in physiology, pathophysiology, cancer, developmental biology, and wound healing. In this study, we sought a novel method to guide cells' spatial displacement by applying soft lithography. We first verified that our new network design has the improved permeability without compensating the patternability. Due to the structural advantages, we demonstrated that our simplified patterning process avoided negative influence to encapsulated cell viability and allowed reliable control over distribution of incorporated cells. The third aspect was to provide a platform to reliably provide biological factors to encapsulated cells in PEG matrices. Because most biomolecules easily lose their therapeutic potency and have specific plasma levels for optimal clinical efficacies, drug delivery systems have been designed to deploy medications intact through a protective medium that can also control the rate of drug release. In this system, we utilized PLGA particles, which were used to improve the permeability, as drug carriers. However, due to the complexity of the release mechanism and the complicated interplay between various design parameters of the release medium, detailed prediction of the resulting release profile is a challenge. Herein we suggest a simple method to target specific release profiles more efficiently by integrating release profiles for an array of different microsphere types. This scheme is based on our observation that the resulting release profile from a mixture of different samples can be predicted as the linear summation of the individually measured release profiles of each sample. Hence, by employing a linear equation at each time point and formulating them as a matrix equation, we could determine how much of each microsphere type to include in a mixture in order to have a specific release profile. In accordance with this method, several targeted release profiles were successfully obtained.

Breast Diseases Radhakrishna Selvi,2014-12-05 It is challenging enough to be able to make a diagnosis in mammography, but the newer standards of care demand more than just providing a diagnosis. This book is an excellent resource to improve the understanding of breast diseases, recognize and manage problems encountered in breast imaging and clinical management of the breast diseases. With forty four chapters, this volume is divided into six sections on screening of breast cancer, imaging modalities, benign breast disorders, interventional procedures, pathological considerations and breast cancer. Breast Diseases: Imaging and Clinical Management is a crisp volume on clinical and multimodality breast imaging with emphasis on interventional procedures, pathology and the entire spectrum of breast cancers.

Medical Image Computing and Computer-Assisted Intervention – MICCAI 2002 Takeyoshi Dohi,Ron Kikinis,2002-09-13 The fifth international Conference in Medical Image Computing and Computer Assisted Intervention (MICCAI 2002) was held in Tokyo from September 25th to 28th, 2002. This was the first time that the conference was held in Asia since its foundation in 1998. The objective of the conference is to offer clinicians and scientists the opportunity to collaboratively create and explore the new medical field. Specifically, MICCAI offers a forum for the discussion of the state of art in computer-assisted interentions, medical robotics, and image processing among experts from multi-disciplinary professions, including but not limited to clinical doctors, computer scientists, and mechanical and biomedical engineers. The expectations of society are very high; the advancement of medicine will depend on computer and device technology in coming decades, as they did in the last decades. We received 321 manuscripts, of which 41 were chosen for oral presentation and 143 for poster presentation. Each paper has been included in these proceedings in eight-page full paper format, without any differentiation between oral and poster papers. Adherence to this full paper format, along with the increased number of manuscripts, surpassing all our expectations, has led us to issue two proceedings volumes for the first time in MICCAI's history. Keeping to a single volume by assigning fewer pages to each paper was certainly an option for us considering our budget constraints. However, we decided to increase the volume to offer authors maximum opportunity to argue the state of art in their work and to initiate constructive discussions among the MICCAI audience.

The Story of the Selma Voting Rights Marches in Photographs David Aretha,2014-01-01 The Civil Rights Act of 1964 was a momentous victory for civil rights activists, but one major obstacle remained in the path toward equal rights for African Americans: the right to vote. In the South,

segregationists prevented African Americans from voting. Civil rights leaders believed it was time for strong action and chose Selma, Alabama, as the rallying point. There, the marches and protests captured the nation's attention. Through gripping primary source photographs, author David Aretha explores this important time in American history.
