Insulating Concrete Forms Construction Ivan Panushev, Pieter Vanderwerf, 2004-02-25

Every year, thousands of general contractors and subcontractors must grapple with whether to bid Insulating Concrete Form (ICF) projects, how much to charge for them, and how to manage the job. ICFs are stronger, energy-efficient, and offer great design flexibility, and their use is growing by 30% a year. This invaluable work walks the contractor through both business and technical considerations in evaluating and adopting Insulating Concrete Forms for both the residential and commercial markets. * Details the entire ICF construction process * Training and supplier information * Actual job site experiences

Insulating Concrete Forms for Residential Design and Construction Pieter A. VanderWerf, 1997 Insulating concrete forms, the most requested new material in home building today, increases energy efficiency, design flexibility, strength and durability. This step-by-step illustrated guide shows designers, architects, and engineers how to put this cutting-edge technology to work. Eight pages of color photos show homes recently constructed with this technology. 178 illus.

The Concrete House Pieter A. VanderWerf, 2007 Prospective homeowners will welcome this introduction to a durable, energy-efficient new building technology: insulating concrete forms (ICFs). Written by a top expert in the field, and organized in an accessible question-and-answer form, it will help homebuyers decide whether an ICF is right for them and how to get the most for their money. Every aspect of planning and construction is covered, from exactly what an ICF is to the intricacies of building a concrete house, from choosing a contractor to selecting a suitable design for the system. There's crucial advice on how to make sure construction goes smoothly, diagrams and photos to illustrate every point, beautiful ICF homes on display, and explanations of how these homes differ from conventional ones and why they cost less to maintain.

Use of Insulating Concrete Forms in Residential Housing Construction Dan C. Lewis, 2000 The use of Insulated Concrete Forms (ICFs) represents a viable alternative construction method to conventional wood framing in today's residential housing marketplace. The Partnership for Advancing Housing Technology, a joint Government-private venture, will further propel the advancement of ICF construction. The National Evaluation Service is currently standardizing the ICF industry building requirements for inclusion in model building codes. There are three types of ICF building units and four types of foam, each with different properties and structural design requirements. Many of ICF material properties provide advantages over wood frame construction, notably in better insulation R-values, fire resistance, sound reduction, air infiltration, consistency of insulation, and strength and durability against severe storms. The cost to build ICF foundations and exterior walls is double the cost of wood frame construction, but overall ICF housing prices are 2-4% more than similar wood frame houses. Homes constructed from ICFs use less energy and therefore will save the owner in energy costs. An analysis of energy savings in cold, moderate, and warm climates and a basic economic analysis can be performed to determine the relationships between the location, energy cost savings, and the added purchase expense. A fairly new industry, the Internet provides a lot of data for ICFs and related construction technologies.

Prescriptive Method for Insulating Concrete Forms in Residential Construction, 1998 Insulating concrete forms (ICFs) are hollow blocks, planks, or panels made from rigid foam

plastic insulation or from composites of cement and other materials and which have the ability to act as forms for cast-in-place concrete walls. While gaining in popularity as an alternative to light-frame construction, the lack of consistent and comprehensive standards has prevented ICF systems from reaching their full potential among builders and officials who may be unfamiliar with this construction technique.

Cyclic Behavior of Screen Grid Insulated Concrete Form Components Carl Scott Werner, 2010 The principle of sustainability in the built environment has become much more significant in the past decade, resulting in a push to develop building systems that are more energy efficient, durable, and use fewer natural resources. For residential and light commercial buildings, insulated concrete forms (ICF) have enjoyed increasing popularity for their ability to meet these new demands. ICFs are a stay-in-place concrete formwork system for building structural walls that are also highly insulated, among other benefits. Screen-grid ICFs (SGICF) are a small subset of ICFs that tend to use less concrete than standard ICFs and are sometimes made of recycled materials. These traits make SGICFs attractive, but there is a lack of understanding of their structural characteristics due to their irregular internal concrete structure. Because of this, structures using SGICFs are limited to heights no higher than two stories. Further study should show whether SGICFs structures can safely be built to greater heights. This investigation studied two types of SGICFs at a component level in order to gain understanding of their lateral force and drift ratio capacities under cyclic loading. Several variables, including steel reinforcement details, the type of concrete, and the presence of the forms, were altered to measure their impact on the performance of the systems. Test results suggested that the ICF formwork increased lateral strength by up to 100% and lateral deformation capacity by up to 60% when compared to identical specimens tested with the formwork removed. Results also showed that confinement of the concrete, either by mesh hoops, spiral wire, or fiber-reinforced concrete improved the drift ratio at failure up to 500% when compared to specimens with no confinement material. Computer models were created to gauge their ability to replicate the behavior of the experimental test results. The models typically overestimated the lateral load resistance of the samples by 50-100%, and even more in some cases, depending on the reinforcement. The models were not reliable in determining the drift ratio at which the sample was considered to have failed. In some cases the model failed at 50% lower lateral deformations than the test specimen, while in others the model did not fail at all. Future studies should explore refinements of the models to increase their accuracy and usefulness, as well as accounting for the contributions due to the form material. Future studies should also include using spiral wires, mesh hoops, or fiber reinforced concrete in full-scale walls to verify their efficacy in improving overall wall performance.

Insulated concrete form walls integrated with mechanical systems in a cold climate test house D. Mallay, J. Wiehagen, 2014 Transitioning from standard light frame to a thermal mass wall system in a high performance home will require a higher level of design integration with the mechanical systems. The much higher mass in the ICF wall influences heat transfer through the wall and affects how the heating and cooling system responds to changing outdoor conditions. This is even more important for efficient, low-load homes with efficient heat pump systems in colder climates where the heating and cooling peak loads are significantly different from standard construction. This report analyzes a range of design features and component performance estimates in an effort to select practical, cost-effective solutions for high performance homes in a cold climate.
