Nonmalignant Hematology Syed A. Abutalib,Jean M. Connors,Margaret V. Ragni,2016-08-24 This book, in Q&A format, addresses a wide range of clinically relevant topics and issues in Nonmalignant Hematology, or “Benign Hematology,” with a view to offering a robust, engaging tool that will assist every hematologist and oncologist (pediatric and adult equally) in making decisions during day-to-day practice. The entire spectrum of the specialty is covered in more than 60 exceptional chapters written by acknowledged authorities in the field. The content is organized into well-designed broad sections on red cell disorders, platelet and coagulation disorders, coagulopathy in systemic diseases, thromboembolic disease and its management (including surgical), immune system and related disorders, hemostasis and thrombosis during pregnancy and in the newborn and elderly, and Transfusion Medicine. A key aspect of the book is the opportunity it affords expert physicians to express well-reasoned opinions regarding complex issues in Nonmalignant Hematology. Readers will find that it provides a practical and immediately applicable compendium of answers to often complex and vexing questions. It will appeal to residents, fellows, house officers and more experienced practitioners around the globe.

Molecular Biology and Immunology of Allergens Dietrich Kraft,Alec Schon,1993-03-25 Molecular Biology and Immunology of Allergens explores the characteristics of natural allergens and allergens produced by recombinant DNA techniques. The book covers important inhalant allergens such as pollen, mites, molds, and pet dander, as well as insect venoms and Chironomid hemoglobin allergens. Biological functions of allergens; the structural definition of allergens by NMR, crystallography, and computer modeling; and the production of recombinant allergens are discussed. Special attention is given to the search for the most effective expression systems in prokaryotic and eukaryotic organisms and the purification of recombinant allergens as fusion and non-fusion proteins. Other topics addressed include the production of allergen-specific T cell clones, the discovery of T cell epitopes by stimulation with overlapping peptides, and methods to induce T cell anergy by tolerogenic allergen-derived peptides. Molecular Biology and Immunology of Allergens will be an excellent reference for all researchers and clinicians in allergology, immunology, molecular biology, allergen extracting, and immunotherapy.

Attosecond Nanophysics Peter Hommelhoff,Matthias Kling,2015-03-09 The first broad and in-depth overview of current research in attosecond nanophysics, covering the field of active plasmonics via attosecond science in metals and dielectrics to novel imaging techniques with the highest spatial and temporal resolution. The authors are pioneers in the field and present here new developments and potential novel applications for ultra-fast data communication and processing, discussing the investigation of the natural timescale of electron dynamics in nanoscale solid state systems. Both an introduction for starting graduate students, as well as a look at the current state of the art in this hot and emerging field.

Carbon Monoxide and Cardiovascular Functions Rui Wang,2001-10-30 Akin to nitric oxide, carbon monoxide (CO) was initially viewed as a pure toxic gas, yet it has been recently demonstrated to be an important endogenous molecule of gas that has profound physiological and pathophysiological effects on the cardiovascular system. In spite of the growing understanding achieved in this field, until now a comprehensive

Handbook of Semidefinite Programming Henry Wolkowicz,Romesh Saigal,Lieven Vandenberghe,2012-12-06 Semidefinite programming (SDP) is one of the most exciting and active research areas in optimization. It has and continues to attract researchers with very diverse backgrounds, including experts in convex programming, linear algebra, numerical optimization, combinatorial optimization, control theory, and statistics. This tremendous research activity has been prompted by the discovery of important applications in combinatorial optimization and control theory, the development of efficient interior-point algorithms for solving SDP problems, and the depth and elegance of the underlying optimization theory. The Handbook of Semidefinite Programming offers an advanced and broad overview of the current state of the field. It contains nineteen chapters written by the leading experts on the subject. The chapters are organized in three parts: Theory, Algorithms, and Applications and Extensions.

Mathematical Statistics with Applications in R Kandethody M. Ramachandran,Chris P. Tsokos,2014-09-14 Mathematical Statistics with Applications in R, Second Edition, offers a modern calculus-based theoretical introduction to mathematical statistics and applications. The book covers many modern statistical computational and simulation concepts that are not covered in other texts, such as the Jackknife, bootstrap methods, the EM algorithms, and Markov chain Monte Carlo (MCMC) methods such as the Metropolis algorithm, Metropolis-Hastings algorithm and the Gibbs sampler. By combining the discussion on the theory of statistics with a wealth of real-world applications, the book helps students to approach statistical problem solving in a logical manner. This book provides a step-by-step procedure to solve real problems, making the topic more accessible. It includes goodness of fit methods to identify the probability distribution that characterizes the probabilistic behavior or a given set of data. Exercises as well as practical, real-world chapter projects are included, and each chapter has an optional section on using Minitab, SPSS and SAS commands. The text also boasts a wide array of coverage of ANOVA, nonparametric, MCMC, Bayesian and empirical methods; solutions to selected problems; data sets; and an image bank for students. Advanced undergraduate and graduate students taking a one or two semester mathematical statistics course will find this book extremely useful in their studies. Step-by-step procedure to solve real problems, making the topic more accessible Exercises blend theory and modern applications Practical, real-world chapter projects Provides an optional section in each chapter on using Minitab, SPSS and SAS commands Wide array of coverage of ANOVA, Nonparametric, MCMC, Bayesian and empirical methods

Membrane Permeability: 100 Years Since Ernest Overton ,1999-05-21 Membrane permeability is fundamental to all cell biology and subcellular

biology. The cell exists as a closed unit. Import and export depend upon a number of sophisticated mechanisms, such as active transport, endocytosis, exocytosis, and passive diffusion. These systems are critical for the normal housekeeping physiological functions. However, access to the cell is also taken advantage of by toxic microbes (such as cholera or ptomaine) and when designing drugs. Ernest Overton, one of the pioneers in lipid membrane research, put forward the first comprehensive theory of lipid membrane structure. His most quoted paper on the osmotic properties of cells laid the foundation for the modern concepts of membrane function, most notably important in anesthesia. This book is designed to celebrate the centennial anniversary (in the first chapter) of Overton's work. Subsequent chapters present readers with up-to-date concepts of membrane structure and function and the challenge they pose for new explorations. Provides an historical perspective of Overton's contributions to the theory of narcosis Presents an overview of each permeability mechanism, including active transport, endocytosis, exocytosis, and passive diffusion
