Mesoscale Spatial and Temporal Variations of Water Mass Characteristics in the California Current Region Off Monterey Bay in 1973-1974 Richard Edward Blumberg, 1975 Continuous salinity and/or temperature profiles were made off the coast of Monterey Bay monthly between August 1973 and August 1974 and on a spatial grid finer than is conventionally used. A procedure is described to convert the data from analog to digital form, process these data on an IBM 360 computer, and print out the results by station for each month. The results show water mass features of small spatial scale detectable only because of the small grid spacing. A gyre or filament structure is suggested by the north to south variation between lines of stations. The extent of the area of the survey is insufficient to describe completely the water mass structure on both the eastern and western boundaries; however, the temporal variation in the observed water mass structure is consistent with the three oceanographic seasons described for the California Current system. Elements of relatively cold water and relatively warm water masses are identified in the area of survey. (Author).

Mesoscale Components of the Geostrophic Flow and Its Temporal and Spatial Variability in the California Current Off Monterey Bay in 1973-74 Richard Earl Greer,1975 The mesoscale components of the geostrophic flow and its temporal and spatial variability are discussed for the oceanic region west of the continental shelf off Monterey Bay. The results were obtained from spatially dense observations on thirteen cruises between Aug 73 and Aug 74. Patterns of current flow indicated by drogues and geostrophy tend to confirm an analysis of the structure which has alternating elements of poleward and equatorward flow. Surface current flow patterns are similar to those found at depths to 375 m. The bottom topography influences the direction of flow inside the 1,000 fathom curve. Seasonal variations of the geostrophic flow and salt transport were congruent with Skogsberg's (1936) annual cycle composed of three distinct oceanographic seasons. The flow and structure in the area are complex with flow elements less than 10 km in width. The data suggest that observations on a sampling grid length less than 10 km transverse to the current flow, and extensive independent current measurements are required to describe adequately the small-scale features of the flow, structure and its time variations.
